Impact of helicopter emergency medical services in major incidents: systematic literature review

Anne Siri Johnsen,1,2,3 Sabina Fattah,1,4 Stephen J M Sollid,1,2 Marius Rehn1,2,5

ABSTRACT

Introduction: Helicopter emergency medical services (HEMS) aim to bring highly specialised crews to the major incident for triage, treatment and transport. When the site is difficult to access, HEMS may be the only mode of transportation of both personnel and patients. This systematic review will identify, describe and appraise literature regarding the role of HEMS in medical response to major incidents. We aim to improve knowledge on HEMS role in a major incident and provide a basis for future research.

Methods and analysis: A systematic literature review will be conducted with search phrases that combine HEMS and major incidents to identify when and how HEMS have been used. Included literature will be subject to quality appraisal and data extraction.

Ethics: No ethical approval is sought because this is a literature review. It will be submitted to a peer-reviewed journal and the PRISMA guidelines will be followed.

INTRODUCTION

A major incident is any incident where the location, number, severity or type of casualties requires extraordinary resources. In 2011, an estimated 392 natural disasters killed over 30 000 people, affected more than 240 million people and caused economic damages for over US$300 billion, with the Tohoku earthquake and tsunami in Japan being the most expensive natural disaster ever recorded.

Helicopter emergency medical services (HEMS) aims to bring a highly specialised crew to the incident for triage, treatment and provide a time-efficient way of transporting patients directly to trauma centre for definitive care. When the site is difficult to access, HEMS may be the only mode of transportation that is viable for both personnel and patients. The triage system in use has to be valid and reliable to prevent both undertriage and overtriage. When specially trained personnel perform the triage, hospitals may avoid reaching their surge capacity. The HEMS crew may also provide an overview of in-hospital resources, thereby increasing the probability of getting the right patient to the right place in the right time. However, HEMS crew combinations may differ from country to country.

In previous literature, death and disease have been the most common outcomes evaluated, while discomfort, disability, dissatisfaction and depth (cost) were infrequently measured. Earlier reviews have tried to determine whether HEMS, compared to ground emergency medical services (GEMS), improve mortality and morbidity, although morbidity was difficult to assess. A meta-analysis on the percentage of HEMS patients transported with non-life-threatening injuries has been performed. Other reviews, with non-systematic design, have aimed to determine outcomes in literature, identify patients that will benefit from HEMS, costs and survival benefits. Assessment of results is difficult because of the heterogeneity of literature.

This systematic review will identify, describe and appraise literature regarding the role of HEMS in medical response to major incidents. We aim to improve knowledge on HEMS role in a major incident and provide the basis for future research.
Box 1  Quality appraisal

<table>
<thead>
<tr>
<th>Internal validity (yes, no, not applicable)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is the author a person directly involved in the major incident medical response?</td>
</tr>
<tr>
<td>Does the literature provide reference to where the data were obtained?</td>
</tr>
<tr>
<td>Does the literature provide reference to how the data were obtained?</td>
</tr>
<tr>
<td>Do the authors have conflicts of interest?</td>
</tr>
<tr>
<td>Has an ethics committee approved the reporting?</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>External validity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Does the literature describe the local emergency medical services (EMS) and helicopter emergency medical services (HEMS) structure before the incident?</td>
</tr>
<tr>
<td>Is the major incident clearly described?</td>
</tr>
<tr>
<td>Are the medical resources used in the major incident response clearly described?</td>
</tr>
<tr>
<td>Does the literature report the type, number and capacity of HEMS?</td>
</tr>
<tr>
<td>Are there indications on missing data?</td>
</tr>
<tr>
<td>Are other limitations discussed?</td>
</tr>
<tr>
<td>Is the study design clearly explained?</td>
</tr>
</tbody>
</table>

Box 2  Different terms and characteristics that will be extracted from the included articles.

Data extraction—does the included literature report the following:

Pre-incident data on affected area

- Basic information on affected area?
- Basic information on affected population?
- Accessibility in the region?
- Other pre-incident data on the affected area?

Helicopter emergency medical services (HEMS) characteristics

- Population covered by HEMS?
- HEMS service area?
- Type of helicopter?
- Crew combination
  - In everyday operations?
  - During a major incident?
- Operating hours?
- Previous experiences with major incidents?
- Other HEMS characteristics?

Incident characteristics

- Time, date and place?
- Description of incident and the damage it caused?
- Number of dead?
- Number of injured
  - Severely, moderately, slightly?
- Total number of victims involved?
- Scene access?
- Distance to hospitals?
- Other incident characteristics?

Incident response

- How the major incident was declared?
- The timeline for the medical response?
- Who participated
  - Personnel (health, fire, police, military)?
  - Transports?
  - Voluntary organizations?
- What tasks they preferred?
- Which prehospital resources were lacking?
- Prehospital surge capacity?
- Patient logistics?
- Hospital surge capacity?
- HEMS
  - Number of crews involved?
  - Time from alarm to arrival at scene?
  - Information received from scene and ambulance dispatch centre?
  - Did they bring extra crew?
  - Did they bring extra equipment?
  - Number of patients transported by HEMS?
  - Which hospitals received the patients?
  - Were other responsibilities described?
  - Were other tasks preferred?
- Communication?
- Scene safety?
- Other incident response data?

Patient characteristics

- All age groups involved?
- Classification of injury?
- Triage at first evaluation?
- Triage before transport?
- Injury score reported?
- Medical illnesses reported and classified?
- Other patient characteristics?
- Other relevant information reported?

METHODS

Study selection

Search terms include ‘Air Ambulance’ AND ‘Major Incidents’ (see additional file 1 for search strategy). The search will include papers published in the period from 1946 to date of search.

Databases:

- MEDLINE
- EMBASE
- Cochrane
- Web of Knowledge
- Swemed
- Norart
- Scopus
- CINAHL
- PsycINFO

Grey literature will not be included. Previous experience has shown that this generates a large workload without results.21

Inclusion criteria:

- Literature describing the role of HEMS in medical response to major incidents.
- Original manuscripts.

Exclusion criteria:

- Articles in languages other than English and Scandinavian.
- Articles without abstract.
- Book chapters.
- Letters to the editor, comments and editorials.

One author (ASJ) will scan titles and abstracts and exclude articles clearly not meeting the inclusion criteria. Uncertain articles based on abstract will be subjected to consensus among all the authors. The remaining articles will be derived in full-text and divided
among the authors in pairs (ASJ and MR, SF and SJMS) and screened further for eligibility according to inclusion and exclusion criteria listed above. The articles excluded in this phase will be listed with reason in the final article. Reference lists of included literature will be scanned to identify relevant literature. Authors of included articles with email listed will be contacted if necessary. ASJ will perform a quality appraisal (box 1) to depict the internal and external validity of the literature at hand and extract pre-defined data from included articles. Data extraction (box 2) will aim to describe the incident background and how HEMS contribute on the scene of the major incident with resources and transportation. Data extraction variables will be entered into a template (box 2) which has been pilot tested on four randomly selected articles. The results of quality appraisal and data extraction will be double-checked by another author. Included articles will be described separately, but articles describing the same major incident will be compared and grouped.

Acknowledgements Marie Isachsen, Ullevål University Hospital Library, Oslo, Norway, designed and will conduct the literature search.

Contributors ASJ and MR conceived the idea. All authors were part of the study design. ASJ, SF, SJMS and MR wrote the manuscript. All authors have approved final version of the protocol.

Funding The Norwegian Air Ambulance Foundation (NAAF) employs all authors. However, the NAAF played no part in study design, data collection, analysis, writing or submitting to publication.

Competing interests None.

Provenance and peer review Not commissioned; externally peer reviewed.
