Figure 2
Figure 3

Examples of Networks without at least One Closed Loop

Figure 4
Figure 5
Figure 6

Here we provide examples of networks with (Figures 1-3) and without (Figures 4-6) at least one closed loop. A closed loop is defined as a comparison with a direct and indirect connection of evidence within the network. For example, in Figure 2, intervention B is compared to intervention C directly, but also indirectly through intervention E, making a closed loop. Presence of at least one closed loop defines the network as a mixed-treatment comparison.
