

# BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (<http://bmjopen.bmj.com>).

If you have any questions on BMJ Open's open peer review process please email [info.bmjopen@bmj.com](mailto:info.bmjopen@bmj.com)

# The impacts of clinical academic activity: Qualitative interviews with healthcare managers and research-active nurses, midwives, allied health professionals and pharmacists

## Abstract

**Objectives:** To explore the perceived impacts of clinical academic activity among the professions outside medicine.

**Design:** Qualitative semi-structured interviews.

**Setting and participants:** There were two groups of interviewees: Research-active nurses, midwives, allied health professionals and pharmacists (NMAHPPs), and managers of these professions. All participants were employed in a single, multi-site healthcare organisation in the UK.

**Outcomes:** Interview transcripts were analysed using the Framework Method to identify key themes, sub-themes, and areas of divergence.

**Results:** Four themes were identified. The first, *cultural shifts*, described the perceived improvements in the approach to patient care and research culture that were associated with clinical academic activity. The second theme explored *visibility* and included the positive reputation that clinical academics were identified as bringing to the organisation in contrast with perceived levels of invisibility and inaccessibility of these roles. The third theme identified the impacts of the *clinical academic pathways*, including the precarity of these roles. The final theme explored *making impact tangible*, and described interviewees' suggestions of possible methods to record and demonstrate impact.

**Conclusions:** Perceived positive impacts of NMAHPP clinical academic activity focused on interlinked positive changes for patients and clinical teams. This included delivery of evidence-based healthcare, patient involvement in clinical decision-making, and improved staff recruitment and retention. However, the positive impacts of clinical academic activity often centred around individual clinicians and did not necessarily translate throughout the organisation. The current clinical academic pathway was identified as

1  
2  
3 51 causing tension between the perceived value of clinical academic activity and the need to find sufficient  
4  
5 52 staffing to cover clinical services.  
6  
7

## 8 53 Strengths and limitations of this study

- 11 54 - This qualitative evaluation illustrates research impacts from the perspective of research-active clinicians  
12 and healthcare managers in the professions outside medicine.
- 13 55 - Existing methodological frameworks for the assessment of research impact focus at the organisational or  
14 56 national levels, whereas we provide individual perspectives.
- 15 57 - The study was limited to employees at a single healthcare organisation and may not reflect other  
16 58 settings.  
17 59

## 24 60 Introduction

27 61 It is widely reported that healthcare organisations that engage in clinical research have better outcomes  
28 62 than their non-research active counterparts [1–5]. Consequently, the UK Care Quality Commission Well-Led  
29 63 inspection framework now includes specific assessment of clinical research activity and leadership [6]. A  
30 64 number of frameworks have been developed to aid recording of research impact both within and across  
31 65 organisations [7, 8]. These have largely focused on academic metrics, such as publications, citations and  
32 66 securing further funding. However, the pertinent components of research impact vary across different  
33 67 contexts [9, 10], and may include other aspects that are not traditionally measured or recorded.  
34 68

39 68 Our recent systematic used a modified VICTOR framework (making Visible the ImpaCt Of Research) to  
40 69 classify the reported impacts of healthcare research led by clinicians from outside medicine [11, 12]. This  
41 70 included broad categories of impact, such as: economic; knowledge exchange; service provision and  
42 71 workforce; and research profile, culture and capacity. It also incorporated the individuals who might be  
43 72 affected: patients; staff (recruitment/retention); and clinical academics. Across these domains, there were  
44 73 several recurring elements that illustrated the challenges and benefits of balancing clinical and academic  
45 74 roles, the creation and implementation of new evidence, and the development of collaborations and  
46 75 networks.  
47 76

53 76 Opportunities for clinicians to engage in research alongside their clinical practice are increasing, particularly  
54 77 through schemes such as the National Institute for Healthcare Research and Health Education England  
55 78 funded 'Integrated Clinical Academic' Fellowships [13]. Imperial College Healthcare NHS Trust (a large  
56 79 hospital group within the UK National Health Service) has developed a strategic plan to increase and support  
57 80 clinical academic activity among the professions outside medicine [14]. We initiated a qualitative service

1  
2  
3 81 evaluation to explore individual perceptions of the impacts of this clinical academic activity, and understand  
4  
5 82 any differences between the views of managers and research-active clinicians. An additional component of  
6  
7 83 the service evaluation explored the question of 'what is a clinical academic?', and has been reported  
8  
9 84 elsewhere [15].  
10  
11  
12

## 13 85 Methods

### 16 86 Design and approvals

18 87 This service evaluation was approved by the Imperial College Healthcare NHS Trust Clinical Audit Team  
19  
20 88 (reference: 418) and followed a pre-specified protocol [16]. The study met the UK Health Research Authority  
21  
22 89 criteria for service evaluation and additional NHS ethics approval was not required [17]. The research team  
23  
24 90 comprised post-doctoral clinicians from nursing and physiotherapy disciplines with previous qualitative  
25  
26 91 research experience. Qualitative semi-structured 1:1 interviews were conducted using pre-piloted topic  
27  
28 92 guides which were developed in collaboration with research-active clinicians and informed by our systematic  
29  
30 93 review of the literature [12] (Supplementary File 1). The COREQ checklist was used to guide reporting [18].  
31  
32

### 32 94 Patient and public involvement

34 95 The focus of this service evaluation was on understanding the perceptions of healthcare managers and  
35  
36 96 clinicians and no patient/public advisors were involved.  
37  
38  
39

### 40 97 Participants and recruitment

42 98 Eligible research-active clinicians were healthcare professionals from any discipline outside medicine who  
43  
44 99 worked within the NHS Trust and were engaged in clinical academic activity [19]. Clinical academic activity  
45  
46 100 was defined as engagement in research alongside clinical practice that was supported by additional funding  
47  
48 101 from clinical research organisations or charities. This included both full and part-time research secondments.  
49  
50 102 Eligible disciplines were: nursing; midwifery; the allied health professions (art therapy, dietetics, drama  
51  
52 103 therapy, music therapy, occupational therapy, orthoptics, operating department practitioners, osteopathy,  
53  
54 104 podiatry, prosthetics and orthotics, paramedics, physiotherapy, radiography, and speech and language  
55  
56 105 therapy); healthcare science and pharmacy. This was abbreviated to NMAHPPs.

57  
58 106 Eligible managers were those responsible for managing any of the professional groups described above. This  
59  
60 107 ranged from line managers through to higher level service managers.

1  
2  
3 108 A purposive sampling strategy was adopted to ensure inclusion of a range of experiences. Sampling criteria  
4  
5 109 and recruitment processes are outlined in Table 1. All participants provided informed written consent after  
6  
7 110 reviewing the participant information sheet (Supplementary File 2). Interviews were conducted by the lead  
8  
9 111 author and were audio recorded and transcribed verbatim by an external transcription company bound by a  
10  
11 112 Non-Disclosure Agreement. Transcripts were anonymised and returned to participants for  
12  
13 113 comment/correction. Anonymisation included names, clinical disciplines, locations and other potentially  
14  
15 114 identifiable characteristics. Recruitment continued until the research team were confident that data  
16  
17 115 saturation had been achieved and the purposive sampling criteria were met. Saturation was defined as the  
18  
19 116 interviewer hearing the same or similar content, and when no new codes were identified during data  
20  
21 117 analysis [20, 21].  
22

### 23 118 Analysis

24  
25 119 Data were managed and analysed using the Framework Method [22, 23], supported by NVivo 12 software  
26  
27 120 (QRS International Ltd). The authors independently coded the first two transcripts and agreed the  
28  
29 121 preliminary coding framework, which was applied to all transcripts by the lead author. Codes were added  
30  
31 122 and modified in response to newly identified items. Any changes were agreed by all authors, and  
32  
33 123 retrospectively applied to pre-coded transcripts. Coded text was summarised, and analytical ideas were  
34  
35 124 logged and explored by all authors using the NVivo framework matrices function to identify both recurring  
36  
37 125 and unique themes discussed by interviewees. Preliminary themes and sub-themes were shared with all the  
38  
39 126 interviewees, nine of whom provided feedback that was incorporated into the final findings (six research-  
40  
41 127 active clinicians and three managers). In addition, preliminary findings were presented to the Trust  
42  
43 128 Postgraduate Research Forum (research-active clinicians from non-medical disciplines) for feedback and  
44  
45 129 comment.

46 131  
47  
48  
49 132 **Results**

50  
51 133 Twenty interviews took place between February and July 2020 (12 research-active clinicians and eight  
52 134 managers). Participant demographics and interview details are provided in Table 1. All purposive sampling  
53 135 criteria were met, with the exception of gender. However, the predominance of women reflects both the  
54 136 local and international distribution of non-medical healthcare professionals [24].  
55  
56  
57

58 137 Three non-hierarchical and interlinking themes were developed that described the reported impacts of  
59 138 clinical academic activity (Figure 1). The first theme explored perceived *cultural shifts* that both involved and

1  
2  
3 139 extended beyond individual research-active clinicians. The second theme described diverging levels of  
4  
5 140 *visibility* for the research-active clinicians within different settings. The third theme examined the challenges  
6  
7 141 and opportunities of the existing *clinical academic pathways*. In addition, a final theme explored *making*  
8  
9 142 *impact tangible* and described interviewees' suggestions of possible methods of capturing impact. All  
10 143 themes are described below with illustrative quotes, and additional quotes are provided in Table 2. No  
11  
12 144 themes or sub-themes were specific to either managers or research-active clinicians and any unique or  
13 145 diverging views among individuals were explored within the sub-themes.  
14  
15  
16

17 146 **Figure 1.** Thematic representation of the impacts of clinical academic activity  
18  
19  
20  
21

## 22 147 Cultural shifts

23 148 Clinical academic activity was perceived to contribute to beneficial cultural changes relating to the provision  
24  
25 149 and delivery of clinical care, and research engagement. Many research-active clinicians recalled how they  
26  
27 150 had noticed positive changes in their *approach to patient care*, which were also adopted by other team  
28  
29 151 members. In addition, managers named clinical academics within their teams as exemplars, highlighting the  
30 152 positive contributions they were making to the local *research culture*.  
31  
32  
33

### 34 153 *Approach to patient care*

35 154 Reported changes to patient care were not isolated to the implementation of findings from the research-  
36 155 active clinicians' own research. Perceived impacts included: increased confidence in questioning practice and  
37 156 openly discussing with patients and colleagues if there was uncertainty over management options; increased  
38 157 involvement of patients in evidence-based treatment decision-making; improved problem solving; and  
39 158 greater awareness of the burden to caregivers. These impacts were reported by both groups of  
40  
41 159 interviewees. Research-active clinicians (R) reflected on their individual experiences, while managers (M)  
42  
43 160 identified how research-active clinicians had generated improvement throughout their clinical team, as  
44 161 illustrated by R2, R6 and M1:  
45  
46  
47  
48  
49

50 162 *"I feel like my standard of care has improved because I'm questioning my practice more, I'm quite*  
51  
52 163 *reflective in my practice and I think that's because I'm trying to think of how can I improve my*  
53 164 *practice... I think it's creating this environment [in the department] of people questioning and*  
54  
55 165 *wanting to improve their practice through what's current, which is really nice to see."* R2, pre-  
56  
57 166 *doctoral*  
58  
59  
60

1  
2  
3 167 *"I suppose my research experience has allowed me to be very upfront with patients and say: 'You*  
4 *know what, this is the evidence we've got so far, I'm going to ask you to do these exercises, we think*  
5 168 *these work for some patients but we don't have enough information yet to know whether they work*  
6 *for all patients. With this in mind, do you still want to proceed?'. So I guess in that way it's helping*  
7 169 *me to make sure that [the] intervention I provide is more patient-led."* R6 post-doctoral  
8 170  
9 171

12 172 *"If you're doing the research it does make you a better clinician in terms of your problem solving and*  
13 *your thinking."* M1  
14 173  
15  
16  
17

### 18 174 *Research culture*

19 175 The majority of research-active clinicians reported that a key personal impact of their research engagement  
20 176 was the opportunity to establish and develop networks with other clinicians who were also interested in  
21 177 research. This included both formal and informal networks, and involved individuals from a range of  
22 178 disciplines. Perceived benefits included being exposed to different research methodologies and research  
23 179 opportunities, practical guidance, and becoming connected with like-minded individuals, as discussed by R5  
24 180 and R7:  
25 180  
26 181  
27 182  
28 183  
29 184

30 181 *"For example, I've gone to some weekend residential things where it's a hodgepodge of clinicians but*  
31 182 *all with the academic pathway... and you all have the same language and lens that you're doing*  
32 183 *things from... that's made it really interesting because I have developed really far-flung contacts and*  
33 184 *networks, so that's been great."* R5, pre-doctoral  
34 185  
35 186  
36 187  
37 188

38 185 *"It introduces you to people like you who are doing similar things but in other places. And so you*  
39 186 *don't feel like what you're doing is like... you don't feel like you're on your own in a way... It gives you*  
40 187 *links across the UK [and] exposure to certain areas and people that I normally wouldn't get."* R7,  
41 188 doctoral  
42  
43  
44  
45  
46

47 189 However, several interviewees also highlighted that despite the support of different individuals and  
48 190 networks, there appeared to be a lack of clinical academic role models for them, particularly at a post-  
49 191 doctoral level. This was identified both within the organisation and nationally, as noted by R9:  
50 191  
51 192

52 192 *"I don't have any [clinical discipline] who has a PhD, there is no advanced practitioner, I don't have*  
53 193 *any [clinical discipline] who is at a higher level who could say okay I want to be your sponsor... So, I*  
54 194 *am finding it difficult to find ways of linking better with the clinical team and utilising the tools and*  
55 195 *the skills that I have been developing over time."* R9, doctoral  
56 196  
57 197  
58 198  
59 199  
60 200

1  
2  
3 196 The importance of role models was also raised by managers, who indicated that a perceived positive impact  
4  
5 197 of the research-active clinicians within their teams was the provision of inspiration and support for other  
6  
7 198 clinicians, as illustrated by M1 and M8:

8  
9 199 *"We have some amazing people who are complete pied pipers... and we need pied pipers in the*  
10  
11 200 *academic world and in the clinical world and in the evidence-based practice world."* M1

12  
13 201 *"We're quite a research-active service. We've got quite a few people who are engaged within*  
14  
15 202 *research, and I think that kind of has bred itself. And I think it also would attract quite a few people*  
16 203 *[to work at the organisation]... Also, having the research-active staff members as well helps promote*  
17  
18 204 *research within the teams."* M8

19  
20  
21  
22 205 Both groups of interviewees discussed the perceived positive impacts research-active clinicians had on a  
23  
24 206 drive towards research and evidence-based practice. This included building research skills and expertise and  
25 207 fostering research engagement, as recalled by R6 and R2. However, some interviews identified that this  
26  
27 208 appeared to be largely driven by the passion and enthusiasm of individual clinical academics, and it was  
28  
29 209 unclear whether this would lead to a sustained change, as reported by M3:

30  
31 210 *"It means that the research becomes part of our business as usual in terms of clinical care. And that's*  
32  
33 211 *for us as well as for our patients."* R6, post-doctoral

34  
35 212 *"I think it is creating this environment [in the clinical department], which is really nice, of people*  
36  
37 213 *questioning and wanting to improve their practice through what's current... People come in to*  
38 214 *approach me... and if they have seen a piece of research, they've talked to me about it... and they'll*  
39  
40 215 *ask me about it. It starts a lot of conversations."* R2, pre-doctoral

41  
42 216 *"I think the people who do it are passionate about wanting to see improvement. And whilst they're in*  
43  
44 217 *a service, their passion is spread across their team. What I've realised is, if they move on, it's not*  
45  
46 218 *always embedded."* M3

47  
48  
49  
50 219 **Visibility**

51  
52 220 Visibility of research-active clinicians was widely discussed, and these individuals were believed to generate  
53  
54 221 a *positive reputation* for the Trust and their clinical discipline more generally. However, within the Trust  
55 222 setting, many interviewees perceived a lack of visibility of their research outside their immediate clinical  
56  
57 223 departments. This led to an interesting discordance between the positive reputation of clinical academics  
58  
59 224 coupled with *(in)visibility and (in)accessibility* of these roles.

### Positive reputation

The perceived positive reputation largely stemmed from showcasing clinical academic successes and opportunities. This included academic outputs, such as publications and presentations as well as developing a national standing, with individuals being contacted to provide clinical and research expertise, as summarised by R11 and M4:

*“On a national level being seen... people do look to me now as someone who’s really taking a lead on that research and so, obviously you have people contacting you for help and support and that kind of thing that comes with it. So, yeah, just being seen as a sort of advocate for that kind of research in our patient group.”* R11, pre-doctoral

*“Having profile and contacts and a voice that carries weight, and that is supported by being a clinical academic without doubt. And enhances the reputation of an NHS service to have experts that are recognised internationally for their research, as well as for their clinical expertise.”* M4

This positive reputation was also perceived to contribute to improved recruitment of clinical staff to the Trust, and the retention of existing staff, as illustrated by M1 and R1:

*“They’re [clinical academics] great for profiling us. They attract people... I don’t know how many interviews I’ve sat in where people say ‘Well I wanted to come to an AHSC [Academic Health Science Centre] and I know you’ve got [named clinical academic] here’... So it’s good for recruitment and retention, I think it’s an aspirational place to work and I think the clinical academics help us to keep it that way.”* M1

*“There’s something around the impact of people being research active, or having clinical academics in teams, around recruitment and retention. I don’t know, but are people more likely to stay in a Trust where they can see that’s an opportunity for them and an option for them... [this could be] a way of keeping people and skilling them up.”* R1, doctoral

### (In)visibility and (in)accessibility

Despite widespread reports that clinical academic activity was beneficial for the reputation of the Trust, many interviewees also reported that their research findings and expertise were underutilised and unknown outside their immediate clinical area, as recalled by M7, R9 and R4:

*“I just don’t think it’s got the profile that it needs to have. I don’t quite know how that should be improved, but proper, [clinical discipline] research, I don’t think, is well understood or widely talked about or well known.”* M7

1  
2  
3 255 *"I still feel that there needs to be more showcasing of what is being done... I don't think it is reaching*  
4 *the people that it needs to reach. So, for example the network events or the [organisation] research*  
5 256 *hubs and all those things, they are very important but they are not reaching the clinical teams, who*  
6 *are the majority of clinical staff in the [department], and who play a huge role in implementing*  
7 257 *research, in helping research happen, in spreading the message about research to patients."* R9,  
8 258  
9  
10 259  
11  
12 260  
13  
14 261

59  
60

Furthermore, it was perceived that research opportunities were not equally accessible for all NMAHPPs across the Trust. This was specifically reported among interviewees from nursing and midwifery professions, as illustrated by R12 and M5:

30 269 *"Before I took this [research project] on, I was very unaware of the numbers of non-medical clinical*  
31 *researchers, very unaware of publications and studies that were going on. I think it's generally very*  
32 270 *under-advertised. The routes into it are not clearly defined."* R12, pre-doctoral  
33  
34 271  
35

36 272 *"We've still got a real issue with research and clinical academia, because I think it's very much a*  
37 *block for people. People assume that it's someone over there that's very academic and very clever,*  
38 273 *that's educated to a higher level than they are."* M5  
39  
40  
41  
42  
43

### 44 275 Clinical academic pathways

45  
46 276 The transient nature of funding for clinical academic work was flagged as a negative impact of the current  
47 277 clinical academic pathway by both researchers and managers. The model in place at the NHS Trust centred  
48 on individuals *applying for research funding* to buy out their clinical time for a specified duration in order to  
49 278 complete their research project or fellowship. This raised two key concerns: what happens *when the funding*  
50 *ends*; and finding suitable *backfill* to support the clinical service. There was also a widespread perception  
51 279 among interviewees that the clinical academic pathway for doctors appeared more clearly defined, and  
52 280 easier to access and navigate, although no one was able to recall what this pathway entailed (*medical*  
53 *model*). Despite these reported challenges, the majority of research-active clinicians were keen to pursue  
54 281

284 further research and reported personal job satisfaction associated with their combined research and clinical  
285 roles, describing this as the *best of both worlds*.

### 286 *Applying for research funding*

287 Research-active clinicians recalled the requirement to secure funding to enable dedicated research time.  
288 This often involved devoting their own time to complete the application and/or preliminary research, as  
289 indicated by R2:

290 *"I was doing my applications for these fellowships and there were two of them and they were both*  
291 *over the same time... so out of work I was doing a lot of the study and I didn't feel like I had a lot of*  
292 *time for myself, and then when I turned up at work it was always crazy so didn't really have... yeah,*  
293 *so I think that was kind of overwhelming me a little bit."* R2 pre-doctoral

294 However, the large majority of research-active clinicians were keen to continue to pursue a clinical academic  
295 career and described their plans for future funding applications. It appeared that a key impact to the  
296 clinicians who had embarked on a programme of research, was a desire to continue to incorporate research  
297 into their clinical role, as illustrated by R1 and R8:

298 *"I mean my aim will be to, as soon as possible, apply for some sort of postdoctoral funding, probably*  
299 *the [Trust] charity because that's probably the most obvious first step."* R1, doctoral

300 *"My desire, and my perspective, and what I want to do, I only feel that much stronger, to be honest*  
301 *with you. I just need to figure out how I can make it work... I would like to do a PhD on this. So, if I do*  
302 *a PhD and prepare myself, I think I would bring a lot of benefit to my Trust."* R8, pre-doctoral

### 303 *When the funding stops*

304 Interviewees also recalled the practical difficulties of returning to their clinical role at the end of each period  
305 of funding as illustrated by R6 and R1 (below). This overlaps with the sub-theme of (in)visibility and  
306 (in)accessibility discussed above.

307 *"For me coming back from my PhD and even in the current environment, without a formal clinical*  
308 *academic pathway I think there's a risk that your research career is going to stall, and I think that*  
309 *happened for me actually immediately after my PhD. And that's a shame, isn't it?"* R6, post-doctoral

310 *"I will just go back to my previous clinical post, which is already starting to, not exactly panic me, but*  
311 *I don't feel like it would be the right thing. I don't feel like it would be exactly the best move for me,*

1  
2  
3 312 *but equally I'll need the job and the money, so I will do it if that's the only option that's available to*  
4  
5 313 *me."* R1, doctoral  
6  
7  
8

9 314 For managers, there was no clear strategy on how to best incorporate the returning research-active  
10  
11 315 clinicians' skills into their clinical role. There appeared to be a friction between a desire to embrace the  
12 316 positive influences on the research culture of the team, with the need to maintain clinical service outputs, as  
13  
14 317 illustrated by M5 and M6:  
15

16 318 *"I mean, how best to use them? Well, I suppose first of all, in a pragmatic way, it's about honouring*  
17  
18 319 *the fact that they've got this knowledge, they've done this piece of research, so it's how we are using*  
19  
20 320 *that research to change the service. There's something about them coming back in and honouring*  
21 321 *their achievement, so, actually should they get paid more? Because this is the trouble. If you don't*  
22  
23 322 *honour them from that perspective, they will go on and be, you know, go into another*  
24  
25 323 *organisation."* M5  
26

27 324 *"It's difficult because you then have to come back to a job, and you've stayed static and others have*  
28  
29 325 *progressed, so you're going to have to drop back down to where you were... You know, having got*  
30 326 *their PhDs is fantastic, but then we're struggling because we have a clinical service to run that we*  
31  
32 327 *can't, you know, I can't give them a post... If they could slot nicely into a clinical academic post that's*  
33  
34 328 *funded, that would be fantastic! The trouble is it's so difficult... we just need them to be working*  
35 329 *[clinically]."* M6  
36  
37  
38  
39

### 40 330 *Backfill chain*

41 331 Most interviewees recalled that a major impact of clinical academic activity, was the need to secure backfill  
42  
43 332 to cover clinical time/duties. This was perceived as being time consuming and creating operational  
44  
45 333 difficulties for managers, particularly if the research fellowships were part-time, or within small  
46 334 departments, as summarised by M3 and M8:  
47

48 335 *"The frustration of backfill is getting comparable people to cover the gap... So you kind of have to*  
49  
50 336 *accept you might have a gap in the service."* M3  
51

52 337 *"It's challenging because often, they are... if it's a full-time fellowship, that can be sometimes easier,*  
53  
54 338 *but what often happens is they're part-time, and that creates a back-fill chain, because the people*  
55  
56 339 *that are taking fellowships are quite senior, so part of the post becomes available, somebody, junior*  
57  
58 340 *to them applies and often is successful, so it creates this backfill chain."* M8  
59  
60

58  
59  
60

341 However M7, who was responsible for a team of >400 clinicians from a single discipline, recalled that they  
342 were able to offer greater flexibility with backfill, due to the size of the department and the nature of the  
343 shift pattern:

*“With shifts, it’s really flexible, so that absolutely wouldn’t be a problem, and with people that go off  
50% of the time to pursue something different, we just cover them. So, it’d be like they’d have a  
clinical job share... we’ve got such a big team, so, actually, losing a few [clinicians to research  
fellowships], it doesn’t have such an impact.” M7*

Interviewees described that “creative thinking” (M4) was required to piece together “a jigsaw” (M8) of the  
necessary backfill. For example, by increasing working hours or downgrading the post:

*“In a weird way I backfilled myself for one day of it because I was only 0.8 so then I went full time and  
needed 0.2 of it and then the other 0.2 we got backfill for.” R11, pre-doctoral*

*“Right now in my post, although I’m 0.5, the 0.5 of my salary is about 0.7 of a [lower clinical grade],  
so they should be time rich for patient care. So you get more for your money with backfilling us, if you  
look at it that way.” R3, post-doctoral*

Others were concerned that downgrading might have a detrimental effect of the long-term sustainability of  
both research fellowships and clinical posts, especially given extensive financial pressures:

*“It centres around the research culture and an understanding of the value of research and then on a  
very practical level just getting support to either undertake a fellowship and get the right and  
appropriate backfill. I mean, I’ve been in a situation where the backfill for my post has actually been  
downgraded because it’s seen as an opportunity to perhaps save some money for the Trust, and  
that’s not sending the right message, is it?” R6, post-doctoral*

### *Medical model*

There was a widespread perception that involvement in clinical academic activity was more accessible for  
doctors compared with NMAHPPs, as discussed by R11 and M1:

*“I think the problem for us as non-medics is that this type of research is not within our career  
progression... people aren’t coming at you like they do with the medics and saying, ‘Okay you’re a  
[junior doctor] and now you’ve got to do your research otherwise you’re not going to get a*

1  
2  
3 368 *consultant post'. It's completely different. And, so because of that, I found it really challenging to*  
4  
5 369 *access any kind of help and support initially."* R11, pre-doctoral  
6

7 370 *"My perception is the medics have got it in the can... but I couldn't tell you what that really means. I*  
8  
9 371 *do know there's probably more of an acceptance or an expectation perhaps that medics do some*  
10  
11 372 *research."* M1  
12  
13

14  
15 373 It appeared that many of the perceived detrimental impacts described above were associated with the  
16 374 absence of a clear clinical academic career pathway for NMAHPPs, several interviewees were concerned that  
17  
18 375 it would not be appropriate to simply replicate the existing model for medics, as illustrated by R5 and M2:  
19

20 376 *"The medics have had that history of those two things [research and clinical practice] being*  
21  
22 377 *intertwined more from a longer time. For [NMAHPPs] it isn't as established, so we're in different*  
23  
24 378 *territory. And whether we should be trying to head the same way or cultivate entirely new*  
25 379 *arrangements is another question, but [we] just don't have that track record."* R5, pre-doctoral  
26

27  
28 380 *"I also think, sadly, that in some of the medical staff, there is a snobbery, and there is a snobbery*  
29 381 *that, actually, only medics do research, and only the research that medics do is valuable and valid,*  
30  
31 382 *and all the rest of it."* M2  
32  
33  
34

### 35 383 *Best of both worlds*

36 384 Despite the challenges described above, the perception among research-active clinicians appeared to be one  
37  
38 385 of enhanced job satisfaction through the combination of clinical and research roles, as illustrated by R9 and  
39  
40 386 R10. This emerged as the driving force for pursuing clinical academic opportunities, and was also highlighted  
41  
42 387 by the majority of managers, as described by M2 and M7 (below):  
43

44 388 *"I would rather be a clinical academic than an academic, because it is what gives me the butterflies.*  
45  
46 389 *It's basically this combination between having hands-on the clinical reality and then based on the*  
47  
48 390 *questions that... are experienced by me in the clinical practice, having the privilege to be given the*  
49 391 *time to go and try to answer them, and then give back the results and the benefits of those answers*  
50  
51 392 *to the clinical environment. That is what really motivates me."* R9, doctoral  
52

53 393 *"Far greater career satisfaction comes from a more varied role... And having the tools to impact care*  
54  
55 394 *at a deeper and wider level beyond the day-to-day level of clinical provision."* R10, post-doctoral  
56  
57  
58  
59  
60

1  
2  
3 395 *"It allows you to combine the best bits of what they want they do into one job, because... I think,*  
4  
5 396 *looking at the people that we've got in the clinical academic roles, it allows them to get the best of*  
6  
7 397 *both worlds for what they want."* M2

8  
9 398 *"I think just giving people opportunities to pursue different avenues, it makes them more motivated*  
10  
11 399 *in-work, as well. So, we know that happy staff provide better patient outcomes, we absolutely know*  
12 400 *that."* M7

## 17 401 Making impact tangible

18 402 All interviewees were asked a general question: how do you think we can best capture and report the impact  
19  
20 403 of clinical academic activity at the Trust? This prompted a range of different responses exploring which  
21  
22 404 impacts were considered important, as well as what could be captured and reported. Responses were  
23  
24 405 broadly categorised as: *direct research outputs, indirect research outputs, workforce impacts, and patient*  
25 406 *impacts*. These categories largely represented the first two themes identified above, with a focus on  
26  
27 407 capturing the impacts that bring positive visibility and cultural change within the Trust.

### 31 408 *Direct research outputs*

32 409 Direct research outputs included metrics that are typically required in fellowship reports, such as  
33  
34 410 publications and conference presentations. While these were perceived as quantifiable measures, there was  
35  
36 411 also an appreciation of quality, such as the impact factor and reach of the journal, and scope and audience of  
37  
38 412 the conference. However, the large majority of interviewees suggested that a better method of measuring  
39 413 research impact might be to explore the implementation of the research findings, as illustrated by R12 and  
40  
41 414 M4:

42  
43 415 *"These were the results of my study, we've changed our practice and here are the opinions of the*  
44  
45 416 *person who did it, the ward manager for example and this is how things have changed'... Those*  
46  
47 417 *would be the kind of statements that have the most weight, in my opinion. This is the positive change*  
48 418 *that can come about through these kinds of fellowships."* R12, pre-doctoral

49  
50  
51 419 *"I mean any kind of change in practice that's based on research that's done that's funded by the*  
52 420 *college or an academic funder. That's what we should focus on. My version, my world of the NHS*  
53  
54 421 *doesn't care about number of publications or where you publish or how many talks you've given.*  
55  
56 422 *That's not an important driver outcome."* M4

### Indirect research outputs

Indirect research outputs focused on the contributions of the research-active clinicians to the development of their profession or clinical specialty. At a national level, this included establishing treatment guidelines, involvement in professional bodies and peer reviewing, as illustrated by R6. Securing funding for additional research projects or clinical services, and sharing learning with the clinical team were also perceived as important impacts locally, as suggested by R10. However, it was acknowledged by several managers that research-active clinicians contributed their own time for many of these activities, as reported by M1.

*"I've been able to influence national [clinical discipline] policy and change practice. So, I mean, that's... it's been very satisfying to see that and to know that that's happened in an evidence-based way... I think we need a way of measuring, you know, if you've been asked to contribute to a national guideline. Is that being recorded somewhere and is that being recognised?"* R6, post-doctoral

*"[Research-activity] leads to further funding or other projects, or supporting others to do work in the field."* R10, post-doctoral

*"They're being asked to speak, they're chairing panels that's all time, and it's rare that the academic PAs [programmed activities] in their job plan fully support all of that activity. And I know from personal experience that people spend an awful lot of their additional own time preparing for things... I think, there's an acceptance people will do a lot in their own time."* M1

### Workforce impacts

Proposed workforce impacts included improved recruitment and retention of staff, as highlighted in the sub-theme *positive reputation* (above), and increased involvement of clinical staff in research, as illustrated by R8 and M8:

*"I think [the] evidence is – each individual department, you can see how many [NMAHPPs] are involved in research, what they're doing, if they have funding permanently, if they are supported – let's say one day a week... So, all of this is evidence that your department is active academically as well as the clinical that is going on."* R8, pre-doctoral

*"Even if somebody's come into the service and hasn't had an interest in research, then, you know, it grows their interest in it, it helps them go down the path."* M8

### Impacts to patients

Interviewees highlighted the importance of capturing changes in patient outcomes that were associated with research activity, however it was acknowledged that associations between research activity and patient

1

2

3 453 outcomes might be difficult to identify, as noted by R1. Other suggestions included feedback from patients  
4  
5 454 and Patient and Public Involvement (PPI) representatives:

6

7 455 *“The broader NHS or Health Education England have acknowledged that a research active trust has*  
8  
9 456 *better outcomes for patients, there must be a way of tracking that, that if you can show a difference*  
10  
11 457 *year on year in terms of the research activity of your clinicians compared to the kind of outcomes of*  
12 458 *patients, but obviously that’s a massive piece of work to stratify it... On a really macro level: ‘Here’s*  
13  
14 459 *how many people are research active, here’s how many patients are having good outcomes’ and*  
15  
16 460 *then, but also on a more micro level, project by project.” R1, doctoral*

17

18 461 *“I think the patient voice has to be the most powerful doesn’t it, the impact on patients and directly*  
19  
20 462 *linking it to that work.” M1*

21

22

23

24 463 **Table 2.** Additional quotes supporting the identified themes and sub-themes

25

Theme	Subtheme	Illustrative quote
Cultural changes	Approach to patient care	<i>I guess anyone that’s going into research is quite passionate about that, and they will often have a specific area that they are passionate about, and keen to improve, bring back any new learning or innovations from outside into clinical practice. M8</i>  <i>You really start to appreciate how much we overlook the role and the burden and influence that caregivers have, and whilst we’ve always tried to obviously include them in our clinical work before, all of our clinical work has a focus which is the patients. R12, pre-doctoral</i>
	Research culture	<i>Support from more experienced clinical academics who can help guide through the challenges that are often faced in this role such as timelines, funding, bureaucracy... R10, post-doctoral</i>  <i>There weren’t many role models in the UK... We need more professors, more AHP professors; there’s actually very few at the moment. R6, post-doctoral</i>  <i>Well, their enthusiasm, for a start, and they can, you know, bring the team with them with their research. M6</i>
Visibility	Positive reputation	<i>I think the PR [public relations], you know, [named research-active clinician] is constantly on Twitter, and so it’s using the [organisation’s] name, the papers that we get published, and again, it’s got the [organisation’s] name on it. M6</i>  <i>If staff are learning and being challenged, they’re probably less likely to leave. R3, post-doctoral</i>
	(In)visibility and (in)accessibility	<i>When I came back from my [doctoral] fellowship, in many ways I almost felt as though I came back in a [junior] role, where I was just churning out patients and not really having the opportunity to share those skills that I had, or to upskill the team. R3, post-doctoral</i>  <i>It’s about understanding that... it’s not that people don’t want to apply, it’s that there are barriers so you’re moving... you’re kind of moving the onus on them not applying rather than the fact that maybe they have different barriers that we haven’t considered. R7, doctoral</i>
Clinical academic pathways	Applying for research funding	<i>I’ve been looking at the most optimum funding opportunities for me to continue what I would like to do as the next stage of my research. I’ve been looking at the NIHR Advanced Fellowship, looking at the timelines for that, the application form, and I’ve been reflecting... I’ve really pulled out the feedback from that and looked at it very carefully to see what sort of work I need to do to make my next application successful. R6, post-doctoral</i>
	When the funding ends	<i>The other side of the coin is that it’s difficult to progress while you’re in it [research fellowship]... It’s hard to progress clinically, it kind of puts you on pause, even though I feel like my clinical skills are developing. R2, pre-doctoral</i>

59

60

		<i>We've been trying to create those roles for a few years now, but the challenge is trying to kind of get the funding to have those dedicated sessions for research, and so the only way in which we're achieving it is through grants and things like that, so all of the research activity going on at the minute is only through awards that enable us to have some research time... But it's not certain, so it's really hard to plan for that, both the clinical backfill piece, but also in terms of what you can then achieve or plan for research-wise. M8</i>
	Backfill	<i>They [research-active clinicians] get some funding to do some research and then they're with us part time and then we have to backfill them and that creates an operational pressure. M1</i>
	Medical model	<i>If you're a doctor on a career in a medical pathway, you will have time out to go and do your research or you'll be required to do your audit or to get your portfolio signed off. You'll need all of that. But actually we're not required to have that, and then we are so desperate just trying to find this frontline staffing. M3</i>  <i>We [NMAHPPs] don't have that expectation of engaging [in research], and that may need to change actually. I think a lot of the narrative we've got about clinical academics comes from the really well-defined pathways of the classic physician. I'm happy that that exists, of course, but I'm anxious that it all seems to be about that kind of model – not anxious, I'm just sometimes unhappy that it all seems to be geared towards having that same model. R4, post-doctoral</i>
	Best of both worlds	<i>The investment is in you to develop it, and that's brilliant, so that means there's a lot of scope to deepen your academic interest area and develop a project. I can see what needs to be done and I don't see blockages; I just see a lack of history with it. R5, pre-doctoral</i>
<b>Making impact tangible</b>	Direct research outputs	<i>I think our definition of impact needs to change radically, because so far impact is publications, and that is all that matters unfortunately... I hope – I think, and I hope, it is starting to change... because the impact that [we need to measure] or want to see is the change that happens in practice. R9, doctoral</i>
	Indirect research outputs	<i>So I think a lot of the staff who are research active are then the ones who sit on various, you know, we've got someone that sits on a [multi-disciplinary national clinical area professional] body, we've got various people who are considered experts within our professional body, who contribute papers and things like that. So I don't know whether that is also a measure of impact in terms of the national influence, because of the bodies that they sit on. M8</i>
	Workforce impacts	<i>I feel like it's made me appreciate [the] Trust so much more, that I've got this opportunity with them and, I just feel really lucky to work here because in other places it might not have happened... Retention is a problem across [the NHS], especially in London, and I'm one of... I'm one of the longer [serving] ones! R2, pre-doctoral</i>
	Impacts to patients	<i>We showed that we could deliver a one stop clinic and that patients loved it, and that they could have surgery on the day, and that they don't need follow-up and they do just fine. So we showed a model that patients really liked, had great satisfaction with and great outcomes, and at the same time saved the trust money. R3, post-doctoral</i>  <i>It would be interesting to capture ways of working or new arrangements of leadership. You could look for evidence of that from the patients and people themselves. They're qualitative things but you can add them up. R5, pre-doctoral</i>

## Discussion

Our qualitative exploration of the perceived impacts of clinical academic activity among NMAHPPs described these impacts across four themes. The first theme described cultural changes including beneficial shifts in patient care and research culture. The second theme explored visibility. Clinical academic activity was believed to generate a positive reputation for the organisation, however there were also perceived elements of invisibility and inaccessibility of clinical academic roles. The third theme discussed the impacts of the clinical academic pathways, including the precarity of clinical academic roles and the associated challenges

472 for individuals and clinical teams. The final theme highlighted possible methods of capturing and reporting  
473 these impacts.

474 Perceived impacts of clinical academic activity were largely positive and focused either directly on the  
475 generation of evidence and the delivery of evidence-based care, or indirectly via expanding research  
476 awareness and providing research support within clinical teams. Similar attributes have been reported  
477 following the introduction of specific research fellowships [25, 26], interventions to increase research  
478 activity among clinical staff [27, 28] and research practitioner roles [29, 30]. In the current study, research  
479 activity was also associated with increased self-confidence in discussing the available evidence with patients  
480 and involving patients in shared clinical decision-making. Person-centred care and shared decision-making  
481 are characteristics that healthcare systems strive for [31, 32], and our findings suggest that research-active  
482 clinicians are well placed to support patients' and clinicians' understanding of the available evidence to  
483 enable informed decision-making. Interviewees emphasised that assessments of research impact should aim  
484 to capture these aspects of care delivery, rather than the current perceived focus on academic outputs, such  
485 as publications, however it was acknowledged that this may be difficult in practice.

486 Published approaches to support and measure research translation and impact within healthcare, include  
487 prospective implementation plans with clearly identified outcomes and use of implementation reporting  
488 guidelines [10, 33]. These strategies may be valuable when exploring the broader impacts of clinical  
489 academic activity, although attributing recorded changes to an individual study remains challenging.

490 Most managers named individual research-active clinicians within their teams and highlighted beneficial  
491 outcomes in terms of service delivery and research engagement. Research-active clinicians were labelled as  
492 "pied pipers" (M1) and drivers of change. However, there were cautionary suggestions that research  
493 engagement was driven by, and often dependent on, these individuals, and was not necessarily fully  
494 embedded in the service. A recent rapid review of theoretical frameworks for embedding research culture  
495 into allied health practice suggested that a sustainable change requires four factors: 1) organisational  
496 structures, policies and governance that support and value evidence-based practice; 2) research capability  
497 and advocacy among health care managers and leaders; 3) dedicated research positions, time allocated to  
498 research, and access to education and research infrastructure; and 4) individual research skills, capabilities  
499 and motivation [34]. Interviewees in the current study described the positive impacts of developing  
500 individual skills, capabilities and motivations, however they also illustrated that the structures to support  
501 research, including protected time and recognition, were not well embedded within the organisation. For  
502 managers, there appeared to be a conflict between wanting to support and enable the development of  
503 research-active clinicians, anticipating the beneficial effects this might have, versus needing sufficient  
504 staffing to provide a clinical service. Our findings suggest that the value of clinical academic research posts

1  
2  
3 505 for the service have not yet been realised and that the tension between 'research' and 'clinical' time still  
4  
5 506 exists. The development of a sustainable research culture requires dedicated research positions, protected  
6  
7 507 research time and a clinical academic career structure, which has proved challenging across international  
8  
9 508 settings [35, 36]. Some organisations have shown that it is possible to develop bespoke solutions to ensure  
10  
11 509 career progression [37].

12 510 The second theme of visibility revealed the role that individual research-active clinicians have in developing  
13  
14 511 research capability and motivating their clinical team. Areas without clinical academic role models may not  
15  
16 512 have the same level of exposure, or encouragement, to pursue research opportunities across the  
17  
18 513 organisation. Without a personal connection to these activities, staff may perceive them as inaccessible.  
19  
20 514 Appropriate NMAHPP role models have previously been identified as enablers of research activity [38], and  
21  
22 515 interviewees in this study gave examples of where this had occurred. However, although interviewees  
23  
24 516 suggested that research engagement should be captured through quantitative data on the number of  
25  
26 517 registered projects (audit, quality, improvement and research) and individuals involved in these projects, no  
27  
28 518 one mentioned using existing measures of research awareness/engagement such as research spider or  
29  
30 519 research culture and capacity survey, which have been reported in other NMAHPP clinical academic contexts  
31  
32 520 [39–41]. It is possible that measures of actual research activity held greater importance for interviewees  
33  
34 521 compared with more abstract measures of research knowledge and research intention; however, it is also  
35  
36 522 possible that interviewees were not aware of the existing survey measures.

37 523 When interviewees were asked about the value of different impacts, sustained opportunities to be involved  
38  
39 524 in research were highlighted as a factor that might improve staff recruitment and retention, and recruitment  
40  
41 525 data was suggested as another method of capturing the impact of clinical academic activity. Similar views  
42  
43 526 have been reported elsewhere [29]. However, while research involvement was seen as a positive driver for  
44  
45 527 the workforce, the process of applying for and securing research funding was also seen as challenging for  
46  
47 528 both individuals and teams. A recent mixed methods study of NMAHPP clinical academic careers  
48  
49 529 recommended investment in clinical academic roles to enable the continued utilisation of research-active  
50  
51 530 clinicians' skills and experience [38]. In our study, the clinical academic model for doctors was perceived as a  
52  
53 531 clearer and more established pathway with dedicated clinical academic positions; however there were  
54  
55 532 concerns that it might not be appropriate, or possible, to directly emulate this pathway due to differences in  
56  
57 533 clinical roles and level of post-graduate clinical experience. While there is growing international interest in  
58  
59 534 the development of sustainable NMAHPP clinical academic careers, current job descriptions and pathways  
60  
61 535 vary and there are few substantive posts [37, 42].

62 536 Comparison of the research impacts reported in the current study with those in existing frameworks  
63  
64 537 highlights interesting contextual differences. Key themes identified in a recent systematic review of  
65  
66 538

1  
2  
3 538 methodological frameworks for impact assessment in healthcare research focused on the macro level, for  
4  
5 539 example influence on policy making and health-related and societal impact [7]. In contrast, interviewees in  
6  
7 540 the current study gave their perspectives of the impacts of the clinical academic activity on the day-to-day  
8  
9 541 delivery of care and the skills and expertise available within their team/department. This may reflect the fact  
10 542 that most of our clinical academic interviewees were early career researchers and had not yet explored  
11  
12 543 impacts beyond the local context. It also illustrates how a broad range of relevant stakeholders will need to  
13  
14 544 be involved in determining local, national or international assessments of research impact [9, 10]. Another  
15 545 difference between our study and existing methodological frameworks was our exploration of the impact of  
16  
17 546 clinical academic activity, rather than research per se. For our interviewees, the process of NMAHPP  
18  
19 547 clinicians getting to a position to be able to conduct research (i.e., securing funding and backfill), and the  
20 548 impact of this on their team were also essential components, which needed to be repeated for each new  
21  
22 549 research study or fellowship.

23  
24 550 Our recent systematic review explored the impacts of NMAHPP clinical academic activity reported in the  
25  
26 551 literature and used the VICTOR framework to categorise the identified impacts. Across all categories, there  
27  
28 552 were three recurring sub-themes: the challenges and benefits of balancing clinical and academic roles;  
29 553 creation and implementation of new evidence; and collaboration and networks. The first two of these sub-  
30  
31 554 themes were also reflected in the current study, suggesting that these are likely to be important features in  
32  
33 555 developing clinical academic careers and areas where impact could be assessed. We believe the ability to  
34 556 develop and utilise collaborations and networks is dependent on securing a clinical academic career  
35  
36 557 structure within individual organisations, and that investment is required to ensure that clinical academics  
37  
38 558 are in a position to progress beyond one-off fellowships.

## 41 42 559 **Limitations**

43  
44 560 The current evaluation was conducted within a large, multi-site NHS organisation and an important  
45 561 limitation is that the findings may not represent different healthcare environments or geographical settings.  
46  
47 562 However, the comparison of our findings with the existing literature suggests that similar themes are likely  
48  
49 563 to be important elsewhere. Our study was not restricted to the evaluation of one specific type of research  
50 564 fellowship, or other intervention, and therefore reflects different clinical academic scenarios that occur  
51  
52 565 within the NHS. Clinical academic activity was defined as engagement in research alongside clinical practice  
53  
54 566 that was supported by additional funding. We acknowledge that other service development and quality  
55 567 improvement activity occurs within the organisation, but we were guided by the Health Research  
56  
57 568 Association definition of research, and therefore did not include activities defined by the former two  
58  
59 569 categories [17].  
60

1  
2  
3 570 It is possible that interviewees may have responded in a way that they felt was socially desirable, however  
4  
5 571 steps were taken to facilitate open dialogue and explore both positive and negative aspects of clinical  
6  
7 572 academic activity. Strategies included an interviewer who was not known to the interviewees in their clinical  
8  
9 573 or research settings, and the opportunity for interviewees to review their transcripts to ensure appropriate  
10  
11 574 anonymity. The research team comprised clinical academics from nursing and physiotherapy. To ensure that  
12  
13 575 study development was informed by a broader range of disciplines, interviewees and other research-active  
14  
15 576 clinicians were included in pre-piloting and refining the interview schedule, reviewing and developing the  
16  
17 577 Framework Analysis and resulting themes/sub-themes to minimise the influence of the study team.

17 578 It was interesting that the views of managers and research-active clinicians were well aligned. Previous  
18  
19 579 research has identified non-facilitating managers at organisational and local levels as key barriers to the  
20  
21 580 development of clinical academic opportunities [36, 43, 44], and this was a problem experienced by some of  
22  
23 581 our clinical academics. However, interviewees were a self-selected population who responded to email  
24  
25 582 invitations to discuss research activity and it is possible that the managers who participated held more  
26  
27 583 positive views towards clinical academic activity than others within and outside the organisation. Managers  
28  
29 584 and research-active clinicians were identified using a purposive sampling strategy aimed at including a  
30  
31 585 breadth of different experiences (clinical discipline, academic level, clinical grade, hospital site). We did not  
32  
33 586 include ethnicity as a sampling criterion, nor collect ethnicity data for participants, and acknowledge this as a  
34  
35 587 limitation.

## 36 37 588 Conclusions

38  
39 589 Perceived positive impacts of NMAHPP clinical academic activity focused on interlinked positive changes for  
40  
41 590 patients and clinical teams. The perception was that for patients, this included access to evidence-based  
42  
43 591 treatment and evidence-informed shared clinical decision-making. For clinical teams, this was experienced  
44  
45 592 through positive changes to the local research culture. The availability of, and support for, research  
46  
47 593 opportunities, were believed to improve staff recruitment and retention within research-active  
48  
49 594 departments. However, these impacts centred around individual research-active clinicians and did not  
50  
51 595 necessarily translate to all areas within the organisation. Moreover, the internal visibility of clinical  
52  
53 596 academics was often limited. The current clinical academic pathway was identified as creating challenges for  
54  
55 597 managers due to a tension between supporting externally funded research-time and having sufficient  
56  
57 598 staffing to cover the clinical service. Our findings suggest that the local impacts of clinical academic activity  
58  
59 599 are important to individuals and to the organisation, but that sustained investment and support are required  
60  
61 600 to ensure that research-active clinicians are able to realise the broad range of positive impacts identified

## Interview Topic Guide – Clinical Academic

### Pre-interview

Consent form complete Check agree to audio recording Assure confidentiality 

Confirm time available for interview \_\_\_\_\_

### Introduction

Aims of the whole service evaluation: explore clinical academic activity among non-medics at the Trust and how we can record the impact of this activity.

Aims of this interview are to find out about your experiences and any suggestions you have for this project.

### Demographic information

#### Primary hospital site

 St Mary's Hospital Hammersmith Hospital Charing Cross Hospital Western Eye Hospital Queen Charlotte's and Chelsea Hospital

Other \_\_\_\_\_

NHS band \_\_\_\_\_

Year of clinical qualification \_\_\_\_\_

#### Clinical discipline

 Nurse Art, drama or music therapist Midwife Clinical research practitioner Dietitian Clinical psychologists Occupational therapist Healthcare scientists Orthoptist Pharmacists Operating department practitioner Osteopath
 Assistant, technician or  
associate of any of these professions (also  
tick relevant professions)
 Podiatrist Prosthetist/orthotist Paramedic Other \_\_\_\_\_ Physiotherapist Radiographer Speech and language therapist

Clinical specialty \_\_\_\_\_

Research fellowships / funding \_\_\_\_\_

What does this fellowship/funding mean for you?

1. Can I start by asking: what your role involves day to day?
  - Prompts*
  - Clinical v academic activities – are these integrated or separate?*
  - Is securing fellowship/research funding or part of role?*
  - Management*
  - Responsibility for supervising others*
  - Education*
  - Career aspirations*
  - What about after your fellowship?*
2. What does the term clinical academic mean to you?
  - Follow up:*
  - Do you see yourself as a clinical academic?*
  - If not, why not? And what might a clinical academic role look like to you*
  - What do you see as the difference between a clinical academic and an academic?*
3. What do you think the role of clinical academics should be within:
  - a) A local team, for example within your team
  - b) The wider department
  - c) Across the whole Trust
  - Prompts*
  - What do you think are the benefits of these types of role?*
4. How would you summarise your research activity at the Trust?
  - Prompts*
  - Focus – clinical care/intervention, patient journey, experience*
  - How did you decide this was something you wanted to be involved with?*
  - Other clinical academic activities e.g. teaching / research support*
5. Do you feel like your perspectives have changed as a result of your research involvement?
  - Prompts*
  - Approach to delivering clinical care*
  - Approach to reviewing/appraising the evidence-base*
  - Has it changed how you feel about your work?*
  - Any change to how you see your career developing?*
  - Are there any activities you are now involved in as a result of your research/fellowship that might not have been possible otherwise?*
6. What do you think are/have been/will be the impacts of your clinical academic activity?
  - Prompts*
  - On patients – clinical care, pathways, experience, satisfaction*
  - On clinical team – have others become involved in research, clinical understanding, time management, project management, presentation skills, any cross over skill?*
  - To the Trust – staffing*
  - Outside the Trust – reputation, wider implication of change in practice*
7. Are there any factors that were particularly helpful for you in generating these impacts?
  - Prompts*
  - Protected time after fellowship*
  - Funding – publications, conferences etc*

8. Have you experienced any obstacles to creating impact from your research?

*Prompts*

*Protected time after fellowship*

*Funding – publications, conferences etc*

*Any differences between the opportunities for medical and non-medical HCPs*

9. Where do you see yourself in 5-10 years time?

*Prompts*

*Role – clinical/academic etc.*

*Locations*

*Goals*

10. How do you think we can best capture and report the impact of our clinical academic activity?

*Prompts*

*Discuss numerical versus qualitative/experiential data*

*What type of data do you think hospital managers are looking for?*

*What type of data do you think the NHS are/should be looking for nationally?*

*Impact assessment tools/ standardised assessment measures*

*Timescales of impacts – when to collect the impact data?*

11. Which of these elements of impact do you think should be most important for the Trust?

*Prioritisation activity using existing impact tool, plus anything else mentioned by interviewee above:*

*Highlight the measures/questions you think are most important*

*Prompt for top 3 measures of impact and reasoning for choices*

*Are there any that you really don't think would be important for the Trust?*

*How do you think this might be different for medics versus non-medics research?*

12. Is there anything else you would like to discuss regarding clinical academic activity?

13. Do you have any questions you would like to ask me?

14. Is there anyone else in the Trust you think it would be particularly useful for me to speak to?

#### Post-interview

Thank interviewee for their time

Assure confidentiality – discuss interview/transcripts in batches

Inform re transcript check, if applicable

Date \_\_\_ / \_\_\_ / \_\_\_

## Interview Topic Guide – Manager

### Pre-interview

Consent form complete Check agree to audio recording Assure confidentiality 

Confirm time available for interview \_\_\_\_\_

### Introduction

Aims of the whole service evaluation: explore clinical academic activity among non-medics at the Trust and how we can record the impact of this activity.

Aims of interview: find out about your views and experiences as a manager of non-medical healthcare professionals

### Demographic information

#### Primary hospital site

 St Mary's Hospital Hammersmith Hospital Charing Cross Hospital Western Eye Hospital Queen Charlotte's and Chelsea Hospital

Other \_\_\_\_\_

NHS band \_\_\_\_\_

Clinical discipline (own background) \_\_\_\_\_

#### Discipline(s) of those responsible for:

 Nurse Art, drama or music therapist Midwife Clinical research practitioner Dietitian Clinical psychologists Occupational therapist Healthcare scientists Orthoptist Pharmacists Operating department practitioner Osteopath
 Assistant, technician or  
associate of any of these professions (also  
tick relevant professions)
 Podiatrist Prosthetist/orthotist Other \_\_\_\_\_ Paramedic Physiotherapist Radiographer Speech and language therapist

Clinical area /specialty \_\_\_\_\_

1  
2  
3 15. First, can I start by asking: what your role involves day to day?

4 *Prompts*

5 *Any clinical duties*

6 *Any involvement in research, service evaluation, audit*

7 *Who are you responsible to – in terms of the management structure, rather than individual names*

8  
9  
10 16. Have you received any funding or dedicated time for research as part of your career?

11 *If not, is this something you would have liked? – why?*

12 *If yes, what did this mean to you?*

13  
14  
15 17. What does the term clinical academic mean to you?

16 *Follow up:*

17 *Do you have any individuals you would describe as clinical academics in your team?*

18 *What about their role makes them a clinical academic?*

19  
20  
21 18. Thinking generally, what do you think the role of clinical academics should be within their:

22 d) Local team

23 e) Wider department

24 f) Trust

25  
26  
27 19. How do you think clinical academic roles might be supported within the NHS?

28 *Prompts*

29 *Career structure*

30 *Roles and responsibilities*

31  
32  
33 20. What is your experience of managing team members involved in any type of clinical research activity?

34 *Prompts*

35 *Types of research activity*

36 *Managing backfill and recruitment*

37 *Managing service delivery*

38 *Role of the clinician within the team e.g. during a research fellowship*

39 *Impact of the clinical academic activity on the wider team*

40 *Any impacts to patient care*

41 *Dissemination activities – writing for publication, presenting at conferences*

42  
43  
44  
45 21. What differences have these individuals made to your team?

46 *Prompts*

47 *During the research*

48 *After the research was finished // or what differences do you anticipate after the research is finished*

49 *Impacts to patients*

50 *Impacts to different team members*

51 *Impact to the individual*

52 *Positives and negatives*

53  
54  
55  
56 *If no experience:*

57 What do you anticipate might be the differences to your team if you were supporting a clinical academic  
58 within your service?

59 *Prompts*

*Backfill and recruitment*

*Service delivery*

*Role of the clinician within the team during research time*

*Impact of the clinical academic activity on the wider team*

*Any impacts to patient care*

*Dissemination activities – writing for publication, presenting at conferences*

*Differences both during and after their research project*

22. Thinking broadly, what do you think are the impacts of clinical academic activity at the Trust?

*Prompt positives and negatives for the:*

*Team*

*Patients*

*Individual*

*Trust*

*Professional discipline / other non-medical professions*

23. How do you think we can best capture these impacts?

*Focus on interviewees ideas initially*

*Prompt numerical data*

*Prompt qualitative/experiential data – how do they think we could capture the value*

*Proceed to discuss contents of existing research impact frameworks/tools*

*Based around the VICTOR tool, which has 6 domains:*

*Health benefits, safety & quality improvements during the study*

*Service and work force impacts*

*Research profile of the organisation and research capacity*

*Economic impacts*

*Organisation's influence and reputation*

*Knowledge generation and knowledge exchange*

24. What measures of impact do you think should be most important for the Trust?

*Prioritisation activity using existing impact tool, plus anything else mentioned by interviewee above:*

*Prompt for top 3 measures of impact and reasoning*

*Are there any that you don't think would be important for the Trust?*

25. Is there anything else you would like to discuss regarding clinical academic activity?

26. Do you have any questions you would like to ask me?

27. Is there anyone else in the Trust you think it would be particularly useful for me to speak to?

#### Post-interview

Thank interviewee for their time

Assure confidentiality – discuss interview/transcripts in batches

Inform re transcript check, if applicable

## Impact of non-medical clinical academics at Imperial College Healthcare NHS Trust (ICHT) – Information for participants

Thank you for your interest in our service evaluation exploring the impact of clinical academic activity among non-medical healthcare professionals. Key information about the project is outlined below. If you have any questions, or would like any additional information, please email Lisa Newington on [l.newington@imperial.ac.uk](mailto:l.newington@imperial.ac.uk).

### Why are we carrying this service evaluation?

In 2018 a 5-year strategic plan was launched at ICHT to promote clinical academic activity among healthcare professionals outside medicine. The aims of the plan, entitled 'Research is Everyone's Business' were to increase research capacity and capability across these professional groups and to enhance the quality and relevance of research outputs to improve patient care. An additional aim was for ICHT to be seen as a leading NHS trust for clinical academic careers. This service evaluation has been developed to assess the perceived impact of clinical academic activity across non-medical healthcare professionals within ICHT. The findings will be used to develop a specific impact assessment framework that will enable the standardised capture of clinical academic research impact in the future.

### Who is eligible to be involved?

We would like to speak to healthcare professionals of any grade who have been involved in clinical research at any level. This evaluation only includes non-medical professions, for example: nurses; midwives; allied health professionals (art therapists, dietitians, drama therapists, music therapists, occupational therapists, orthoptists, operating department practitioners, osteopaths, podiatrists, prosthetists/orthotists, paramedics, physiotherapists, radiographers, and speech and language therapists); clinical psychologists; healthcare scientists and pharmacists. Assistants, technicians and support workers within these disciplines are also invited to take part. We would also like to be speak to service managers for these professions.

### Who is in the service evaluation team?

The evaluation is being led by Lisa Newington, with support from Caroline Alexander and Mary Wells. Contact details are provided at the end of this information sheet. A small number of research fellows and clinical students may also be involved in anonymised stages of the analysis, to provide an opportunity for their learning and development. Their involvement will be supervised and monitored by the service evaluation team.

### What will the interview involve?

The interview will be a one-off discussion with Lisa Newington. This will be guided by questions about your experience of being involved in clinical research, how you think clinical academic activity can be supported within the Trust and how we could/should measure the impact of this activity. The interview will be audio recorded to allow a qualitative analysis of the key themes across all interviews. If you would prefer to be interviewed with a colleague or colleagues, this can be accommodated. Interviews will be arranged at a time and location that is convenient for you and are anticipated to take 30-45 minutes. You will be given the opportunity to review the

interview text once it is transcribed, and to provide feedback on the initial analysis. It is up to you whether or not you wish to be involved in these steps.

### Will my contribution be anonymous?

The recorded interview will be transcribed by an external company who are bound by a confidentiality agreement. Transcripts will be filed using an anonymous reference code. Identifiable data (your name and clinical specialty) will be logged separately. The project report for ICHT will include illustrative quotes to support the themes identified. It may be helpful to include participant names and clinical speciality in support of existing clinical activity, however these details will not be included without your expressed permission for the particular quote and in the specific context. Any journal publications that result from this project will not include any identifiable information.

### Who has approved this project?

This service evaluation has been approved by the Imperial College Healthcare NHS Trust audit office ([imperial.audit@nhs.net](mailto:imperial.audit@nhs.net); reference 418). The project is funded by NIHR Imperial Biomedical Research Centre (BRC).

### What if I no longer wish to be involved?

You can request for your interview to be removed from this project for 21 days after the interview, at which point the audio file and transcript will be deleted. After this time, the anonymous transcripts will have been incorporated into the analysis and it will not be possible to remove individual components. Before 01/08/2020, you can still request that no quotes from your interview are used in the final reports. Please email [l.newington@imperial.ac.uk](mailto:l.newington@imperial.ac.uk) if you wish to make either of these requests.

### Who should I contact if I have a complaint about the project?

Please speak to one of the service evaluation team in the first instant using the contact details below. Alternatively, you can contact the Trust audit office on 0203 312 2460 or [imperial.audit@nhs.net](mailto:imperial.audit@nhs.net).

## COREQ Checklist

Item	Guide questions	Response	Section
<b>Domain 1: Research team and reflexivity</b>			
<b>Personal characteristics</b>			
<i>Interviewer</i>	Which author conducted the interviews?	Lead author	Methods: participants and recruitment, p4
<i>Credentials</i>	What were the researcher's credentials?	Post-doctoral researcher	Methods: design and approvals, p3
<i>Occupation</i>	What was their occupation at the time of the study?	Physiotherapist	Methods: design and approvals, p3
<i>Gender</i>	Was the researcher male or female?	Female	Author names
<i>Experience and training</i>	What experience or training did the researcher have?	Previous qualitative experience	Methods: design and approvals, p3
<b>Relationship with participants</b>			
<i>Relationship established</i>	Was a relationship established prior to study commencement?	Research team and interviewees were based within the same healthcare organisation. Interviewees were not known to the lead author in clinical/research capacity	Methods: study design and approvals, p3 Discussion: limitations, p22
<i>Participant knowledge of the interview</i>	What did participants know about the research?	A participant information sheet was provided prior to involvement in the service evaluation	Methods: participants and recruitment, p4
<i>Interviewer characteristics</i>	What characteristics were reported about the interviewer?	Background research and clinical positions discussed	Methods: design and approvals, p3
<b>Domain 2: Study design</b>			
<b>Theoretical framework</b>			
Methodological orientation and theory	What methodological orientation was stated to underpin the study?	Qualitative service evaluation	Methods: design and approvals, p3
<b>Participant selection</b>			
Sampling	How were participants selected?	Purposive sampling strategy, criteria are reported	Methods: participants and recruitment, p4
Method of approach	How were participants approached?	By invitation email and provision of the participant information sheet.	Methods: participants and recruitment, p4
Sample size	How many participants were in the study?	20	Results: participants, p6 Table 1

Item	Guide questions	Response	Section
Non-participation	How many people refused to participate or dropped out? Reasons?	8 individuals did not respond to the invitation email. None of the participants dropped out	Table 1
<b>Setting</b>			
Setting of data collection	Where was the data collected?	A combination of face-to-face, video and telephone interview. One interview was also completed by email	Table 1
Presence of non-participants	Was anyone else present beside participants and researchers?	No additional people were present for the face-to-face interviews. Interviewees were asked to find a private place where they were comfortable to talk for the video and phone interviews	
Description of sample	What are the important characteristics of the sample	Demographic and key occupational characteristics are reported	Table 1
<b>Data collection</b>			
Interview guide	Were questions, prompts, guides provided by the authors? Was it pilot tested?	A pre-piloted interview schedule, including questions and prompts, was used throughout	Methods: design and approvals, p3 Additional file
Repeat interviews	Were repeat interviews carried out? If so, how many?	No repeat interviews were performed	Methods: design and approvals, p3 Table 1
Audio / visual recording	How did the researchers record the data?	Interviews were audio recorded and one was completed by email	Methods: participants and recruitment, p4
Field notes	Were field notes made during and/or after the interview?	Notes were made during and after the interviews and were recorded in the interview log	Methods: participants and recruitment, p4
Duration	What was the duration of the interviews?	Interview durations are reported	Table 1
Data saturation	Was data saturation discussed?	Data saturation was defined in advance and used to guide the number of interviews	Methods: participants and recruitment, p4
Transcripts returned	Were transcripts returned to participants for comment/correction?	Transcripts were reviewed by the lead author and compared with the audio file. Transcripts were returned to participants for checking, where this option was selected on their consent form	Methods: analysis, p4
<b>Domain 3: Analysis and findings</b>			
<b>Data analysis</b>			
Number of data coders	How many data coders coded the data?	Three researchers coded the initial two transcripts to develop the coding frame. Subsequent transcripts were coded by the lead author and reviewed by the research team	Methods: analysis, p4

## Impacts of clinical academic activity

# The impacts of clinical academic activity: Qualitative interviews with healthcare managers and research-active nurses, midwives, allied health professionals and pharmacists

## Abstract

**Objectives:** To explore the perceived impacts of clinical academic activity among the professions outside medicine.

**Design:** Qualitative semi-structured interviews.

**Setting and participants:** There were two groups of interviewees: Research-active nurses, midwives, allied health professionals and pharmacists (NMAHPPs), and managers of these professions. All participants were employed in a single, multi-site healthcare organisation in the UK.

**Analysis:** Interview transcripts were analysed using the Framework Method to identify key themes, sub-themes, and areas of divergence.

**Results:** Four themes were identified. The first, *cultural shifts*, described the perceived improvements in the approach to patient care and research culture that were associated with clinical academic activity. The second theme explored *visibility* and included the positive reputation that clinical academics were identified as bringing to the organisation in contrast with perceived levels of invisibility and inaccessibility of these roles. The third theme identified the impacts of the *clinical academic pathways*, including the precarity of these roles. The final theme explored *making impact tangible*, and described interviewees' suggestions of possible methods to record and demonstrate impact.

**Conclusions:** Perceived positive impacts of NMAHPP clinical academic activity focused on interlinked positive changes for patients and clinical teams. This included delivery of evidence-based healthcare, patient involvement in clinical decision-making, and improved staff recruitment and retention. However, the positive impacts of clinical academic activity often centred around individual clinicians and did not necessarily translate throughout the organisation. The current clinical academic pathway was identified as

1  
2  
3 51 causing tension between the perceived value of clinical academic activity and the need to find sufficient  
4  
5 52 staffing to cover clinical services.

7

## 8 53 Strengths and limitations of this study

- 11 54 - This qualitative evaluation illustrates research impacts from the perspective of research-active clinicians  
12 and healthcare managers in the professions outside medicine.
- 13 55
- 14 56 - Existing methodological frameworks for the assessment of research impact focus at the organisational or  
15 national levels, whereas we provide individual perspectives.
- 16 57
- 17 58 - The study was limited to employees at a single healthcare organisation and may not reflect other  
18  
19 59 settings.  
20  
21  
22  
23

## 24 60 Introduction

27 61 It is widely reported that healthcare organisations that engage in clinical research have better outcomes  
28 than their non-research active counterparts [1–5]. For example, research activity has been associated with  
29 62 improvements in organisational performance and efficiency, patient satisfaction and confidence in their  
30 63 healthcare professionals, and staff satisfaction [3, 6]. Research activity has also been associated with  
31  
32 64 reductions in mortality and staff turnover [2, 5, 6]. Consequently, the UK Care Quality Commission Well-Led  
33 inspection framework now includes specific assessment of clinical research activity and leadership [7]. A  
34 65 number of frameworks have been developed to aid recording of research impact both within and across  
35 66 organisations [8, 9]. These have largely focused on academic metrics, such as publications, citations and  
36  
37 67 securing further funding. However, the pertinent components of research impact vary across different  
38 68 contexts [10, 11], and may include other aspects that are not traditionally measured or recorded. Our recent  
39  
40 69 systematic review used a modified VICTOR framework (making Visible the ImpaCt Of Research) to classify  
41  
42 70 the reported impacts of healthcare research led by clinicians from outside medicine [12, 13]. This included  
43  
44 71 broad categories of impact, such as: economic; knowledge exchange; service provision and workforce; and  
45  
46 72 research profile, culture and capacity. It also incorporated the individuals who might be affected: patients;  
47  
48 73 staff (recruitment/retention); and clinical academics. Across these domains, there were several recurring  
49  
50 74 elements that illustrated the challenges and benefits of balancing clinical and academic roles, the creation  
51  
52 75 and implementation of new evidence, and the development of collaborations and networks.  
53  
54 76  
55

56 78 Within medicine, there are various career pathways and structures to support clinical academic roles [14,  
57 79 15]. Opportunities for non-medical clinicians to engage in research alongside their clinical practice are now  
58  
59 80 increasing, particularly through schemes such as the National Institute for Healthcare Research and Health  
60

1  
2  
3 81 Education England funded 'Integrated Clinical Academic' Fellowships [16]. This is in addition to research  
4  
5 82 leadership capacity building initiatives such as the NHS 70@70 [17], research internships for newly qualified  
6  
7 83 clinicians [18], nursing, midwifery and allied health professionals research awards [19], and discipline-  
8  
9 84 specific research capacity building initiatives, such as the NIHR Nursing and Midwifery Incubator [20].  
10  
11 85 Imperial College Healthcare NHS Trust (a large hospital group within the UK National Health Service) has  
12  
13 86 developed a strategic plan to increase and support clinical academic activity among the professions outside  
14  
15 87 medicine [21]. We initiated a qualitative interview study to explore individual perceptions of the impacts of  
16  
17 88 this clinical academic activity, and understand any differences between the views of managers and research-  
18  
19 89 active clinicians. An additional component of this study explored the question of 'what is a clinical  
20  
21 90 academic?', and has been reported elsewhere [22].  
22

## 23 91 Methods

### 24 25 92 Design and approvals

26 93 The study was approved by the Imperial College Healthcare NHS Trust Clinical Audit Team (reference: 418)  
27  
28 94 and followed a pre-specified protocol [23]. Additional NHS ethics approval was not required [24]. The  
29  
30 95 research team comprised post-doctoral clinicians from nursing and physiotherapy disciplines with previous  
31  
32 96 qualitative research experience. Qualitative semi-structured 1:1 interviews were conducted using pre-  
33  
34 97 piloted topic guides which were informed by our systematic review of the literature [13] (Supplementary File  
35  
36 98 1). The COREQ checklist was used to guide reporting [25].  
37  
38  
39

### 40 99 Patient and public involvement

41  
42 100 The focus of this study was on understanding the perceptions of healthcare managers and clinicians from the  
43  
44 101 professions outside medicine. Patient/public advisors were not specifically involved; however, the wider  
45  
46 102 topic of research impact was discussed with two public representatives as part of our larger programme of  
47  
48 103 research [26]. Interview topic guides were developed in collaboration with research-active clinicians from  
49  
50 104 both within and outside the NHS Trust. Involvement included providing feedback and suggestions on the  
51  
52 105 initial draft, piloting and further refining the final version. The medical and dentistry community were not  
53  
54 106 included in this stakeholder work because their clinical academic careers are already well established, and  
55  
56 107 our emphasis was solely on the professions outside medicine.  
57  
58  
59  
60

## Participants and recruitment

Imperial College Healthcare NHS Trust is a large multi-site NHS organisation situated in north west London, UK. The Trust provides a range of specialist healthcare services located in both in- and out-patient settings, and serves around a million people per year, with a staff of >13,000 [27]. Eligible research-active clinicians were healthcare professionals from any discipline outside medicine who worked within the NHS Trust and were engaged in clinical academic activity [28]. This included: nursing; midwifery; the allied health professions (art therapy, dietetics, drama therapy, music therapy, occupational therapy, orthoptics, operating department practitioners, osteopathy, podiatry, prosthetics and orthotics, paramedics, physiotherapy, radiography, and speech and language therapy); healthcare science clinical psychology and pharmacy, as abbreviated to NMAHPPs. Clinical academic activity was defined as engagement in research alongside clinical practice that was supported by additional funding from clinical research organisations or charities. This included both full and part-time research secondments.

Eligible managers were those responsible for managing any of the professional groups described above. This ranged from line managers through to higher level service managers. Permission to directly contact individuals was granted through the Trust Clinical Audit and Service Evaluation Team. Potential interviewees were contacted by email, using addresses that were openly accessible through the NHS or university email systems.

A purposive sampling strategy was adopted to ensure inclusion of a range of experiences. This also included snowball sampling techniques, with interviewees and potential interviewees asked to suggest other research-active clinicians and managers. Sampling criteria and recruitment processes are outlined in Table 1. All participants provided informed written consent after reviewing the participant information sheet (Supplementary File 2). Interviews were conducted by the lead researcher and were delivered face-to-face or remotely, according to interviewee preference. The interviews were audio recorded and transcribed verbatim by an external transcription company bound by a Non-Disclosure Agreement. Transcripts were anonymised and returned to participants for comment/correction. Anonymisation included removal of names, clinical disciplines, locations and other potentially identifiable characteristics. Recruitment continued until the research team were confident that data saturation had been achieved and the purposive sampling criteria were met. Saturation was defined as the interviewer hearing the same or similar content, and when no new codes were identified during data analysis [29, 30].

**Table 1.** Recruitment details and sampling criteria

<b>Identification</b>	i) Existing database of healthcare professionals at the Trust with external research funding ii) Open invitation via Trust Twitter and e-bulletin	i) Trust leadership directory ii) Open invitation via Trust Twitter and e-bulletin iii) Suggestions from interviewees
<b>Recruitment</b>	17 email invitations 13 agreed to be interviewed	11 email invitations 9 agreed to be interviewed
<b>Sampling criteria</b>	Clinical discipline and/or speciality NHS Grade Gender Hospital site within the Trust Academic level	Clinical discipline and/or speciality NHS Grade Gender

## Analysis

Data were managed and analysed using the Framework Method [31, 32], supported by NVivo 12 software (QRS International Ltd). The authors independently coded the first two transcripts and agreed the preliminary coding framework, which was applied to all transcripts by the lead author. Codes were added and modified in response to newly identified items. Any changes were agreed by all authors, and retrospectively applied to pre-coded transcripts. Coded text was summarised, and analytical ideas were logged and explored thematically by all authors using the NVivo framework matrices function to identify both recurring and unique themes discussed by interviewees. Preliminary themes and sub-themes were shared with all the interviewees, nine of whom provided feedback that was incorporated into the final findings (six research-active clinicians and three managers). In addition, preliminary findings were presented to the Trust Postgraduate Research Forum (research-active clinicians from non-medical disciplines) for feedback and comment. Example feedback included discussion on how the individual codes could be arranged as themes and sub-themes, suggestions for the wording of the theme headings and ideas for the design of the summary model.

## Results

Twenty interviews took place between February and July 2020 (12 research-active clinicians and eight managers). Participant demographics and interview details are provided in Table 2. None of the invited managers or research active clinicians actively refused to participate, but there were two non-responders within the manager group, and four within the research-active clinician group. An additional two individuals (one in each group) were unable to schedule an interview due to changeable work commitments associated with the Covid-19 response. Three individuals responded to the Twitter invitation, although all three had already been identified as potential participants. All purposive sampling criteria were met, with the

Three non-hierarchical and interlinking themes were developed that described the reported impacts of clinical academic activity (Figure 1). The first theme explored perceived *cultural shifts* that both involved and extended beyond individual research-active clinicians. The second theme described diverging levels of *visibility* for the research-active clinicians within different settings. The third theme examined the challenges and opportunities of the existing *clinical academic pathways*. In addition, a final theme explored *making impact tangible* and described interviewees' suggestions of possible methods of capturing impact. All themes are described below with illustrative quotes, and additional quotes are provided in Table 3. No themes or sub-themes were specific to either managers or research-active clinicians and any unique or diverging views among individuals were explored within the sub-themes.

**Figure 1.** Thematic representation of the impacts of clinical academic activity

Figure legend: NMAHPPS nurses, midwives, allied health professionals, healthcare scientists, psychologists and pharmacists

## Cultural shifts

Clinical academic activity was perceived to contribute to beneficial cultural changes relating to the provision and delivery of clinical care, and research engagement. Many research-active clinicians recalled how they had noticed positive changes in their *approach to patient care*, which were also adopted by other team members. In addition, managers named clinical academics within their teams as exemplars, highlighting the positive contributions they were making to the local *research culture*.

### *Approach to patient care*

Reported changes to patient care were not isolated to the implementation of findings from the research-active clinicians' own research. Perceived impacts included: increased confidence in questioning practice and openly discussing with patients and colleagues if there was uncertainty over management options; increased involvement of patients in evidence-based treatment decision-making; improved problem solving; and greater awareness of the burden to caregivers. These impacts were reported by both groups of interviewees. Research-active clinicians (R) reflected on their individual experiences, while managers (M) identified how research-active clinicians had generated improvement throughout their clinical team, as illustrated by R2, R6 and M1:

*"I feel like my standard of care has improved because I'm questioning my practice more, I'm quite reflective in my practice and I think that's because I'm trying to think of how can I improve my practice... I think it's creating this environment [in the department] of people questioning and wanting to improve their practice through what's current, which is really nice to see."* R2, pre-doctoral

*"I suppose my research experience has allowed me to be very upfront with patients and say: 'You know what, this is the evidence we've got so far, I'm going to ask you to do these exercises, we think these work for some patients but we don't have enough information yet to know whether they work for all patients. With this in mind, do you still want to proceed?'. So I guess in that way it's helping me to make sure that [the] intervention I provide is more patient-led."* R6 post-doctoral

*"If you're doing the research it does make you a better clinician in terms of your problem solving and your thinking."* M1

### *Research culture*

The majority of research-active clinicians reported that a key personal impact of their research engagement was the opportunity to establish and develop networks with other clinicians who were also interested in

1  
2  
3 207 research. This included both formal and informal networks, and involved individuals from a range of  
4  
5 208 disciplines. Perceived benefits included being exposed to different research methodologies and research  
6  
7 209 opportunities, practical guidance, and becoming connected with like-minded individuals, as discussed by R5  
8 210 and R7:  
9

10  
11 211 *“For example, I’ve gone to some weekend residential things where it’s a hodgepodge of clinicians but*  
12 212 *all with the academic pathway... and you all have the same language and lens that you’re doing*  
13  
14 213 *things from... that’s made it really interesting because I have developed really far-flung contacts and*  
15  
16 214 *networks, so that’s been great.” R5, pre-doctoral*  
17

18 215 *“It introduces you to people like you who are doing similar things but in other places. And so you*  
19  
20 216 *don’t feel like what you’re doing is like... you don’t feel like you’re on your own in a way... It gives you*  
21 217 *links across the UK [and] exposure to certain areas and people that I normally wouldn’t get.” R7,*  
22  
23 218 *doctoral*  
24  
25  
26

27 219 However, several interviewees also highlighted that despite the support of different individuals and  
28  
29 220 networks, there appeared to be a lack of clinical academic role models for them, particularly at a post-  
30  
31 221 doctoral level. This was identified both within the organisation and nationally, as noted by R9:  
32

33 222 *“I don’t have any [clinical discipline] who has a PhD, there is no advanced practitioner, I don’t have*  
34 223 *any [clinical discipline] who is at a higher level who could say okay I want to be your sponsor... So, I*  
35  
36 224 *am finding it difficult to find ways of linking better with the clinical team and utilising the tools and*  
37  
38 225 *the skills that I have been developing over time.” R9, doctoral*  
39  
40  
41

42 226 The importance of role models was also raised by managers, who indicated that a perceived positive impact  
43  
44 227 of the research-active clinicians within their teams was the provision of inspiration and support for other  
45 228 clinicians, as illustrated by M1 and M8:  
46

47 229 *“We have some amazing people who are complete pied pipers... and we need pied pipers in the*  
48  
49 230 *academic world and in the clinical world and in the evidence-based practice world.” M1*  
50

51 231 *“We’re quite a research-active service. We’ve got quite a few people who are engaged within*  
52 232 *research, and I think that kind of has bred itself. And I think it also would attract quite a few people*  
53 233 *[to work at the organisation]... Also, having the research-active staff members as well helps promote*  
54  
55 234 *research within the teams.” M8*  
56  
57  
58  
59  
60

Both groups of interviewees discussed the perceived positive impacts research-active clinicians had on a drive towards research and evidence-based practice. This included building research skills and expertise and fostering research engagement, as recalled by R6 and R2. However, some interviews identified that this appeared to be largely driven by the passion and enthusiasm of individual clinical academics, and it was unclear whether this would lead to a sustained change, as reported by M3:

*"It means that the research becomes part of our business as usual in terms of clinical care. And that's for us as well as for our patients."* R6, post-doctoral

*"I think it is creating this environment [in the clinical department], which is really nice, of people questioning and wanting to improve their practice through what's current... People come in to approach me... and if they have seen a piece of research, they've talked to me about it... and they'll ask me about it. It starts a lot of conversations."* R2, pre-doctoral

*"I think the people who do it are passionate about wanting to see improvement. And whilst they're in a service, their passion is spread across their team. What I've realised is, if they move on, it's not always embedded."* M3

## Visibility

Visibility of research-active clinicians was widely discussed, and these individuals were believed to generate a *positive reputation* for the Trust and their clinical discipline more generally. However, within the Trust setting, many interviewees perceived a lack of visibility of their research outside their immediate clinical departments. This led to an interesting discordance between the positive reputation of clinical academics coupled with *(in)visibility and (in)accessibility* of these roles.

### *Positive reputation*

The perceived positive reputation largely stemmed from showcasing clinical academic successes and opportunities. This included academic outputs, such as publications and presentations as well as developing a national standing, with individuals being contacted to provide clinical and research expertise, as summarised by R11 and M4:

*"On a national level being seen... people do look to me now as someone who's really taking a lead on that research and so, obviously you have people contacting you for help and support and that kind of thing that comes with it. So, yeah, just being seen as a sort of advocate for that kind of research in our patient group."* R11, pre-doctoral

1  
2  
3 264 *“Having profile and contacts and a voice that carries weight, and that is supported by being a clinical*  
4 *academic without doubt. And enhances the reputation of an NHS service to have experts that are*  
5 265 *recognised internationally for their research, as well as for their clinical expertise.” M4*  
6  
7 266  
8  
9

10  
11 267 This positive reputation was also perceived to contribute to improved recruitment of clinical staff to the  
12 268 Trust, and the retention of existing staff, as illustrated by M1 and R1:  
13

14  
15 269 *“They’re [clinical academics] great for profiling us. They attract people... I don’t know how many*  
16 270 *interviews I’ve sat in where people say ‘Well I wanted to come to an AHSC [Academic Health Science*  
17 *Centre] and I know you’ve got [named clinical academic] here’... So it’s good for recruitment and*  
18 271 *retention, I think it’s an aspirational place to work and I think the clinical academics help us to keep it*  
19 *that way.” M1*  
20 272  
21 273  
22

23  
24 274 *“There’s something around the impact of people being research active, or having clinical academics*  
25 275 *in teams, around recruitment and retention. I don’t know, but are people more likely to stay in a*  
26 *Trust where they can see that’s an opportunity for them and an option for them... [this could be] a*  
27 276 *way of keeping people and skilling them up.” R1, doctoral*  
28  
29 277  
30

### 31 32 33 278 *(In)visibility and (in)accessibility*

34 279 Despite widespread reports that clinical academic activity was beneficial for the reputation of the Trust,  
35  
36 280 many interviewees also reported that their research findings and expertise were underutilised and unknown  
37  
38 281 outside their immediate clinical area, as recalled by M7, R9 and R4:  
39

40 282 *“I just don’t think it’s got the profile that it needs to have. I don’t quite know how that should be*  
41 *improved, but proper, [clinical discipline] research, I don’t think, is well understood or widely talked*  
42 283 *about or well known.” M7*  
43  
44 284  
45

46 285 *“I still feel that there needs to be more showcasing of what is being done... I don’t think it is reaching*  
47 *the people that it needs to reach. So, for example the network events or the [organisation] research*  
48 286 *hubs and all those things, they are very important but they are not reaching the clinical teams, who*  
49 287 *are the majority of clinical staff in the [department], and who play a huge role in implementing*  
50 *research, in helping research happen, in spreading the message about research to patients.” R9,*  
51 288 *doctoral*  
52  
53 289  
54 290  
55

56  
57 291 *“It’s been sad that my clinical NHS organisation doesn’t really seem to be... promoting or engaging*  
58 292 *with, [or] even knowing about, [my research] work. And not just my work...I see that with other*  
59 *colleagues... and all their [research] has had no impact in how we work at the Trust level. And, yeah,*  
60 293

1  
2  
3 294 *that sort of, doesn't really feel right, that I'm much more known in [another continent] than in my*  
4  
5 295 *hospital, or elsewhere than in my hospital. And that not being known is important."* R4, post-doctoral  
6  
7  
8

9 296 Furthermore, it was perceived that research opportunities were not equally accessible for all NMAHPPs  
10  
11 297 across the Trust. This was specifically reported among interviewees from nursing and midwifery professions,  
12 298 as illustrated by R12 and M5:  
13

14  
15 299 *"Before I took this [research project] on, I was very unaware of the numbers of non-medical clinical*  
16 300 *researchers, very unaware of publications and studies that were going on. I think it's generally very*  
17  
18 301 *under-advertised. The routes into it are not clearly defined."* R12, pre-doctoral  
19

20 302 *"We've still got a real issue with research and clinical academia, because I think it's very much a*  
21  
22 303 *block for people. People assume that it's someone over there that's very academic and very clever,*  
23  
24 304 *that's educated to a higher level than they are."* M5  
25  
26  
27

## 28 305 **Clinical academic pathways**

29  
30 306 The transient nature of funding for clinical academic work was flagged as a negative impact of the current  
31  
32 307 clinical academic pathway by both researchers and managers. The model in place at the NHS Trust centred  
33 308 on individuals *applying for research funding* to buy out their clinical time for a specified duration in order to  
34  
35 309 complete their research project or fellowship. This raised two key concerns: what happens *when the funding*  
36 310 *ends*; and finding suitable *backfill* to support the clinical service. There was also a widespread perception  
37  
38 311 among interviewees that the clinical academic pathway for doctors appeared more clearly defined, and  
39  
40 312 easier to access and navigate, although no one was able to recall what this pathway entailed (*medical*  
41  
42 313 *model*). Despite these reported challenges, the majority of research-active clinicians were keen to pursue  
43 314 further research and reported personal job satisfaction associated with their combined research and clinical  
44  
45 315 roles, describing this as the *best of both worlds*.  
46  
47  
48

## 49 316 **Applying for research funding**

50  
51 317 Research-active clinicians recalled the requirement to secure funding to enable dedicated research time.  
52 318 This often involved devoting their own time to complete the application and/or preliminary research, as  
53  
54 319 indicated by R2:  
55

56 320 *"I was doing my applications for these fellowships and there were two of them and they were both*  
57  
58 321 *over the same time... so out of work I was doing a lot of the study and I didn't feel like I had a lot of*  
59  
60

1  
2  
3  
4  
5  
6  
7  
8

322 *time for myself, and then when I turned up at work it was always crazy so didn't really have... yeah,*  
 323 *so I think that was kind of overwhelming me a little bit."* R2 pre-doctoral

9 324 However, the large majority of research-active clinicians were keen to continue to pursue a clinical academic  
 10 career and described their plans for future funding applications. It appeared that a key impact to the  
 11 325 clinicians who had embarked on a programme of research, was a desire to continue to incorporate research  
 12 326 into their clinical role, as illustrated by R1 and R8:  
 13

16 328 *"I mean my aim will be to, as soon as possible, apply for some sort of postdoctoral funding, probably*  
 17 *the [Trust] charity because that's probably the most obvious first step."* R1, doctoral

20 330 *"My desire, and my perspective, and what I want to do, I only feel that much stronger, to be honest*  
 21 *with you. I just need to figure out how I can make it work... I would like to do a PhD on this. So, if I do*  
 22 331 *a PhD and prepare myself, I think I would bring a lot of benefit to my Trust."* R8, pre-doctoral  
 23  
 24 332

### 28 333 *When the funding stops*

29 334 Interviewees also recalled the practical difficulties of returning to their clinical role at the end of each period  
 30 of funding as illustrated by R6 and R1 (below). This overlaps with the sub-theme of (in)visibility and  
 31 335 (in)accessibility discussed above.  
 32

35 337 *"For me coming back from my PhD and even in the current environment, without a formal clinical*  
 36 *academic pathway I think there's a risk that your research career is going to stall, and I think that*  
 37 338 *happened for me actually immediately after my PhD. And that's a shame, isn't it?"* R6, post-doctoral  
 38  
 39 339

41 340 *"I will just go back to my previous clinical post, which is already starting to, not exactly panic me, but*  
 42 *I don't feel like it would be the right thing. I don't feel like it would be exactly the best move for me,*  
 43 341 *but equally I'll need the job and the money, so I will do it if that's the only option that's available to*  
 44 342 *me."* R1, doctoral  
 45  
 46 343

50 344 For managers, there was no clear strategy on how to best incorporate the returning research-active  
 51 clinicians' skills into their clinical role. There appeared to be a friction between a desire to embrace the  
 52 345 positive influences on the research culture of the team, with the need to maintain clinical service outputs, as  
 53 346 illustrated by M5 and M6:  
 54

57 348 *"I mean, how best to use them? Well, I suppose first of all, in a pragmatic way, it's about honouring*  
 58 *the fact that they've got this knowledge, they've done this piece of research, so it's how we are using*  
 59 349  
 60

1  
2  
3 350 *that research to change the service. There's something about them coming back in and honouring*  
4  
5 351 *their achievement, so, actually should they get paid more? Because this is the trouble. If you don't*  
6  
7 352 *honour them from that perspective, they will go on and be, you know, go into another*  
8 353 *organisation."*M5  
9

10  
11 354 *"It's difficult because you then have to come back to a job, and you've stayed static and others have*  
12 355 *progressed, so you're going to have to drop back down to where you were... You know, having got*  
13  
14 356 *their PhDs is fantastic, but then we're struggling because we have a clinical service to run that we*  
15  
16 357 *can't, you know, I can't give them a post... If they could slot nicely into a clinical academic post that's*  
17 358 *funded, that would be fantastic! The trouble is it's so difficult... we just need them to be working*  
18  
19 359 *[clinically]."* M6  
20  
21  
22

### 23 360 *Backfill chain*

24  
25 361 Most interviewees recalled that a major impact of clinical academic activity, was the need to secure backfill  
26  
27 362 to cover clinical time/duties. This was perceived as being time consuming and creating operational  
28 363 difficulties for managers, particularly if the research fellowships were part-time, or within small  
29  
30 364 departments, as summarised by M3 and M8:  
31

32 365 *"The frustration of backfill is getting comparable people to cover the gap... So you kind of have to*  
33  
34 366 *accept you might have a gap in the service."* M3  
35

36 367 *"It's challenging because often, they are... if it's a full-time fellowship, that can be sometimes easier,*  
37  
38 368 *but what often happens is they're part-time, and that creates a back-fill chain, because the people*  
39  
40 369 *that are taking fellowships are quite senior, so part of the post becomes available, somebody, junior*  
41 370 *to them applies and often is successful, so it creates this backfill chain."* M8  
42  
43  
44

45 371 However M7, who was responsible for a team of >400 clinicians from a single discipline, recalled that they  
46  
47 372 were able to offer greater flexibility with backfill, due to the size of the department and the nature of the  
48  
49 373 shift pattern:

50  
51 374 *"With shifts, it's really flexible, so that absolutely wouldn't be a problem, and with people that go off*  
52  
53 375 *50% of the time to pursue something different, we just cover them. So, it'd be like they'd have a*  
54 376 *clinical job share... we've got such a big team, so, actually, losing a few [clinicians to research*  
55  
56 377 *fellowships], it doesn't have such an impact."* M7  
57  
58  
59  
60

1

2

3 378 Interviewees described that “creative thinking” (M4) was required to piece together “a jigsaw” (M8) of the  
4 necessary backfill. For example, by increasing working hours or downgrading the post:

6

7 380 *“In a weird way I backfilled myself for one day of it because I was only 0.8 so then I went full time and  
8 needed 0.2 of it and then the other 0.2 we got backfill for.”* R11, pre-doctoral

10

11 382 *“Right now in my post, although I’m 0.5, the 0.5 of my salary is about 0.7 of a [lower clinical grade],  
12 so they should be time rich for patient care. So you get more for your money with backfilling us, if you  
13 383 look at it that way.”* R3, post-doctoral  
14  
15 384

16

17

18

19 385 Others were concerned that downgrading might have a detrimental effect of the long-term sustainability of  
20 386 both research fellowships and clinical posts, especially given extensive financial pressures. For example, the  
21 risk that clinical posts could become permanently downgraded, potentially undermining the value of the  
22 387 service, and that of the research-active clinicians:

23

24 388 *“It centres around the research culture and an understanding of the value of research and then on a  
25 very practical level just getting support to either undertake a fellowship and get the right and  
26 389 appropriate backfill. I mean, I’ve been in a situation where the backfill for my post has actually been  
27 downgraded because it’s seen as an opportunity to perhaps save some money for the Trust, and  
28 390 that’s not sending the right message, is it?”* R6, post-doctoral  
29  
30  
31 392  
32  
33 393

34

35

36

### 37 394 *Medical model*

38 395 There was a widespread perception that involvement in clinical academic activity was more accessible for  
39 doctors compared with NMAHPPs, as discussed by R11 and M1:

40

41 397 *“I think the problem for us as non-medics is that this type of research is not within our career  
42 progression... people aren’t coming at you like they do with the medics and saying, ‘Okay you’re a  
43 398 [junior doctor] and now you’ve got to do your research otherwise you’re not going to get a  
44 consultant post’. It’s completely different. And, so because of that, I found it really challenging to  
45 access any kind of help and support initially.”* R11, pre-doctoral  
46 399  
47  
48 400

49

50 401 *“My perception is the medics have got it in the can... but I couldn’t tell you what that really means. I  
51 do know there’s probably more of an acceptance or an expectation perhaps that medics do some  
52 402 research.”* M1  
53 403  
54  
55 404

56

57

58

59

60

1  
2  
3 405 It appeared that many of the perceived detrimental impacts described above were associated with the  
4  
5 406 absence of a clear clinical academic career pathway for NMAHPPs, several interviewees were concerned that  
6  
7 407 it would not be appropriate to simply replicate the existing model for medics, as illustrated by R5 and M2:

8  
9 408 *“The medics have had that history of those two things [research and clinical practice] being*  
10  
11 409 *intertwined more from a longer time. For [NMAHPPs] it isn’t as established, so we’re in different*  
12 410 *territory. And whether we should be trying to head the same way or cultivate entirely new*  
13  
14 411 *arrangements is another question, but [we] just don’t have that track record.” R5, pre-doctoral*

15  
16 412 *“I also think, sadly, that in some of the medical staff, there is a snobbery, and there is a snobbery*  
17  
18 413 *that, actually, only medics do research, and only the research that medics do is valuable and valid,*  
19  
20 414 *and all the rest of it.” M2*

### 21 22 23 24 415 *Best of both worlds*

25 416 Despite the challenges described above, the perception among research-active clinicians appeared to be one  
26  
27 417 of enhanced job satisfaction through the combination of clinical and research roles, as illustrated by R9 and  
28  
29 418 R10. This emerged as the driving force for pursuing clinical academic opportunities, and was also highlighted  
30  
31 419 by the majority of managers, as described by M2 and M7 (below):

32  
33 420 *“I would rather be a clinical academic than an academic, because it is what gives me the butterflies.*  
34  
35 421 *It’s basically this combination between having hands-on the clinical reality and then based on the*  
36 422 *questions that... are experienced by me in the clinical practice, having the privilege to be given the*  
37  
38 423 *time to go and try to answer them, and then give back the results and the benefits of those answers*  
39  
40 424 *to the clinical environment. That is what really motivates me.” R9, doctoral*

41  
42 425 *“Far greater career satisfaction comes from a more varied role... And having the tools to impact care*  
43  
44 426 *at a deeper and wider level beyond the day-to-day level of clinical provision.” R10, post-doctoral*

45  
46  
47  
48 427 *“It allows you to combine the best bits of what they want they do into one job, because... I think,*  
49 428 *looking at the people that we’ve got in the clinical academic roles, it allows them to get the best of*  
50  
51 429 *both worlds for what they want.” M2*

52  
53 430 *“I think just giving people opportunities to pursue different avenues, it makes them more motivated*  
54  
55 431 *in-work, as well. So, we know that happy staff provide better patient outcomes, we absolutely know*  
56  
57 432 *that.” M7*

## Making impact tangible

All interviewees were asked a general question: how do you think we can best capture and report the impact of clinical academic activity at the Trust? This prompted a range of different responses exploring which impacts were considered important, as well as what could be captured and reported. Responses were broadly categorised as: *direct research outputs*, *indirect research outputs*, *workforce impacts*, and *patient impacts*. These categories largely represented the first two themes identified above, with a focus on capturing the impacts that bring positive visibility and cultural change within the Trust.

### *Direct research outputs*

Direct research outputs included metrics that are typically required in fellowship reports, such as publications and conference presentations. While these were perceived as quantifiable measures, there was also an appreciation of quality, such as the impact factor and reach of the journal, and scope and audience of the conference. However, the large majority of interviewees suggested that a better method of measuring research impact might be to explore the implementation of the research findings, as illustrated by R12 and M4:

*“These were the results of my study, we’ve changed our practice and here are the opinions of the person who did it, the ward manager for example and this is how things have changed’... Those would be the kind of statements that have the most weight, in my opinion. This is the positive change that can come about through these kinds of fellowships.” R12, pre-doctoral*

*“I mean any kind of change in practice that’s based on research that’s done that’s funded by the college or an academic funder. That’s what we should focus on. My version, my world of the NHS doesn’t care about number of publications or where you publish or how many talks you’ve given. That’s not an important driver outcome.” M4*

### *Indirect research outputs*

Indirect research outputs focused on the contributions of the research-active clinicians to the development of their profession or clinical specialty. At a national level, this included establishing treatment guidelines, involvement in professional bodies and peer reviewing, as illustrated by R6. Securing funding for additional research projects or clinical services, and sharing learning with the clinical team were also perceived as important impacts locally, as suggested by R10. However, it was acknowledged by several managers that research-active clinicians contributed their own time for many of these activities, as reported by M1.

1  
2  
3 462 *"I've been able to influence national [clinical discipline] policy and change practice. So, I mean,*  
4  
5 463 *that's... it's been very satisfying to see that and to know that that's happened in an evidence-based*  
6  
7 464 *way... I think we need a way of measuring, you know, if you've been asked to contribute to a national*  
8 465 *guideline. Is that being recorded somewhere and is that being recognised?"* R6, post-doctoral  
9

10  
11 466 *"[Research-activity] leads to further funding or other projects, or supporting others to do work in the*  
12 467 *field."* R10, post-doctoral  
13

14  
15 468 *"They're being asked to speak, they're chairing panels that's all time, and it's rare that the academic*  
16 469 *PAs [programmed activities] in their job plan fully support all of that activity. And I know from*  
17  
18 470 *personal experience that people spend an awful lot of their additional own time preparing for*  
19  
20 471 *things... I think, there's an acceptance people will do a lot in their own time."* M1  
21  
22  
23

### 24 472 *Workforce impacts*

25 473 Proposed workforce impacts included improved recruitment and retention of staff, as highlighted in the sub-  
26  
27 474 theme *positive reputation* (above), and increased involvement of clinical staff in research, as illustrated by R8  
28  
29 475 and M8:

30  
31 476 *"I think [the] evidence is – each individual department, you can see how many [NMAHPPs] are*  
32  
33 477 *involved in research, what they're doing, if they have funding permanently, if they are supported –*  
34  
35 478 *let's say one day a week... So, all of this is evidence that your department is active academically as*  
36 479 *well as the clinical that is going on."* R8, pre-doctoral  
37

38 480 *"Even if somebody's come into the service and hasn't had an interest in research, then, you know, it*  
39  
40 481 *grows their interest in it, it helps them go down the path."* M8  
41  
42  
43

### 44 482 *Impacts to patients*

45 483 Interviewees highlighted the importance of capturing changes in patient outcomes that were associated  
46  
47 484 with research activity, however it was acknowledged that associations between research activity and patient  
48  
49 485 outcomes might be difficult to identify, as noted by R1. Other suggestions included feedback from patients  
50  
51 486 and Patient and Public Involvement (PPI) representatives:

52  
53 487 *"The broader NHS or Health Education England have acknowledged that a research active trust has*  
54  
55 488 *better outcomes for patients, there must be a way of tracking that, that if you can show a difference*  
56  
57 489 *year on year in terms of the research activity of your clinicians compared to the kind of outcomes of*  
58 490 *patients, but obviously that's a massive piece of work to stratify it... On a really macro level: 'Here's*  
59

*how many people are research active, here's how many patients are having good outcomes' and then, but also on a more micro level, project by project."* R1, doctoral

*"I think the patient voice has to be the most powerful doesn't it, the impact on patients and directly linking it to that work."* M1

For peer review only

496 **Table 3.** Additional quotes supporting the identified themes and sub-themes

Theme	Subtheme	Illustrative quote
Cultural changes	Approach to patient care	<i>I guess anyone that's going into research is quite passionate about that, and they will often have a specific area that they are passionate about, and keen to improve, bring back any new learning or innovations from outside into clinical practice. M8</i>  <i>You really start to appreciate how much we overlook the role and the burden and influence that caregivers have, and whilst we've always tried to obviously include them in our clinical work before, all of our clinical work has a focus which is the patients. R12, pre-doctoral</i>
	Research culture	<i>Support from more experienced clinical academics who can help guide through the challenges that are often faced in this role such as timelines, funding, bureaucracy... R10, post-doctoral</i>  <i>There weren't many role models in the UK... We need more professors, more AHP professors; there's actually very few at the moment. R6, post-doctoral</i>  <i>Well, their enthusiasm, for a start, and they can, you know, bring the team with them with their research. M6</i>
Visibility	Positive reputation	<i>I think the PR [public relations], you know, [named research-active clinician] is constantly on Twitter, and so it's using the [organisation's] name, the papers that we get published, and again, it's got the [organisation's] name on it. M6</i>  <i>If staff are learning and being challenged, they're probably less likely to leave. R3, post-doctoral</i>
	(In)visibility and (in)accessibility	<i>When I came back from my [doctoral] fellowship, in many ways I almost felt as though I came back in a [junior] role, where I was just churning out patients and not really having the opportunity to share those skills that I had, or to upskill the team. R3, post-doctoral</i>  <i>It's about understanding that... it's not that people don't want to apply, it's that there are barriers so you're moving... you're kind of moving the onus on them not applying rather than the fact that maybe they have different barriers that we haven't considered. R7, doctoral</i>
Clinical academic pathways	Applying for research funding	<i>I've been looking at the most optimum funding opportunities for me to continue what I would like to do as the next stage of my research. I've been looking at the NIHR Advanced Fellowship, looking at the timelines for that, the application form, and I've been reflecting... I've really pulled out the feedback from that and looked at it very carefully to see what sort of work I need to do to make my next application successful. R6, post-doctoral</i>
	When the funding ends	<i>The other side of the coin is that it's difficult to progress while you're in it [research fellowship]... It's hard to progress clinically, it kind of puts you on pause, even though I feel like my clinical skills are developing. R2, pre-doctoral</i>  <i>We've been trying to create those roles for a few years now, but the challenge is trying to kind of get the funding to have those dedicated sessions for research, and so the only way in which we're achieving it is through grants and things like that, so all of the research activity going on at the minute is only through awards that enable us to have some research time... But it's not certain, so it's really hard to plan for that, both the clinical backfill piece, but also in terms of what you can then achieve or plan for research-wise. M8</i>
	Backfill	<i>They [research-active clinicians] get some funding to do some research and then they're with us part time and then we have to backfill them and that creates an operational pressure. M1</i>
	Medical model	<i>If you're a doctor on a career in a medical pathway, you will have time out to go and do your research or you'll be required to do your audit or to get your portfolio signed off. You'll need all of that. But actually we're not required to have that, and then we are so desperate just trying to find this frontline staffing. M3</i>  <i>We [NMAHPPs] don't have that expectation of engaging [in research], and that may need to change actually. I think a lot of the narrative we've got about clinical academics comes from the really well-defined pathways of the classic physician. I'm happy that that exists, of course, but I'm anxious that it all seems to be about that kind of model – not anxious, I'm just sometimes unhappy that it all seems to be geared towards having that same model. R4, post-doctoral</i>
	Best of both worlds	<i>The investment is in you to develop it, and that's brilliant, so that means there's a lot of scope to deepen your academic interest area and develop a project. I can see what needs to be done and I don't see blockages; I just see a lack of history with it. R5, pre-doctoral</i>

<b>Making impact tangible</b>	Direct research outputs	<i>I think our definition of impact needs to change radically, because so far impact is publications, and that is all that matters unfortunately... I hope – I think, and I hope, it is starting to change... because the impact that [we need to measure] or want to see is the change that happens in practice. R9, doctoral</i>
	Indirect research outputs	<i>So I think a lot of the staff who are research active are then the ones who sit on various, you know, we've got someone that sits on a [multi-disciplinary national clinical area professional] body, we've got various people who are considered experts within our professional body, who contribute papers and things like that. So I don't know whether that is also a measure of impact in terms of the national influence, because of the bodies that they sit on. M8</i>
	Workforce impacts	<i>I feel like it's made me appreciate [the] Trust so much more, that I've got this opportunity with them and, I just feel really lucky to work here because in other places it might not have happened... Retention is a problem across [the NHS], especially in London, and I'm one of... I'm one of the longer [serving] ones! R2, pre-doctoral</i>
	Impacts to patients	<i>We showed that we could deliver a one stop clinic and that patients loved it, and that they could have surgery on the day, and that they don't need follow-up and they do just fine. So we showed a model that patients really liked, had great satisfaction with and great outcomes, and at the same time saved the trust money. R3, post-doctoral</i>  <i>It would be interesting to capture ways of working or new arrangements of leadership. You could look for evidence of that from the patients and people themselves. They're qualitative things but you can add them up. R5, pre-doctoral</i>

## Discussion

Our qualitative exploration of the perceived impacts of clinical academic activity among NMAHPPs described these impacts across four themes. The first theme described cultural changes including beneficial shifts in patient care and research culture. The second theme explored visibility. Clinical academic activity was believed to generate a positive reputation for the organisation, however there were also perceived elements of invisibility and inaccessibility of clinical academic roles. The third theme discussed the impacts of the clinical academic pathways, including the precarity of clinical academic roles and the associated challenges for individuals and clinical teams. The final theme highlighted possible methods of capturing and reporting these impacts.

Perceived impacts of clinical academic activity were largely positive and focused either directly on the generation of evidence and the delivery of evidence-based care, or indirectly via expanding research awareness and providing research support within clinical teams. Similar attributes have been reported following the introduction of specific research fellowships [34, 35], interventions to increase research activity among clinical staff [36, 37] and research practitioner roles [38, 39]. In the current study, research activity was also associated with increased self-confidence in discussing the available evidence with patients and involving patients in shared clinical decision-making. Person-centred care and shared decision-making are characteristics that healthcare systems strive for [40, 41], and our findings suggest that research-active clinicians are well placed to support patients' and clinicians' understanding of the available evidence to enable informed decision-making. Interviewees emphasised that assessments of research impact should aim

1  
2  
3 517 to capture these aspects of care delivery, rather than the current perceived focus on academic outputs, such  
4  
5 518 as publications, however it was acknowledged that this may be difficult in practice. Published approaches to  
6  
7 519 support and measure research translation and impact within healthcare, include prospective  
8  
9 520 implementation plans with clearly identified outcomes and use of implementation reporting guidelines [11,  
10 521 42]. These strategies may be valuable when exploring the broader impacts of clinical academic activity,  
11  
12 522 although attributing recorded changes to an individual study remains challenging.

13  
14 523 Most managers named individual research-active clinicians within their teams and highlighted beneficial  
15  
16 524 outcomes in terms of service delivery and research engagement. Research-active clinicians were labelled as  
17 525 “pied pipers” (M1) and drivers of change. However, there were cautionary suggestions that research  
18  
19 526 engagement was driven by, and often dependent on, these individuals, and was not necessarily fully  
20  
21 527 embedded in the service. A recent rapid review of theoretical frameworks for embedding research culture  
22 528 into allied health practice suggested that a sustainable change requires four factors: 1) organisational  
23  
24 529 structures, policies and governance that support and value evidence-based practice; 2) research capability  
25  
26 530 and advocacy among health care managers and leaders; 3) dedicated research positions, time allocated to  
27  
28 531 research, and access to education and research infrastructure; and 4) individual research skills, capabilities  
29 532 and motivation [43]. Interviewees in the current study described the positive impacts of developing  
30  
31 533 individual skills, capabilities and motivations, however they also illustrated that the structures to support  
32  
33 534 research, including protected time and recognition, were not well embedded within the organisation. For  
34 535 managers, there appeared to be a conflict between wanting to support and enable the development of  
35  
36 536 research-active clinicians, anticipating the beneficial effects this might have, versus needing sufficient  
37  
38 537 staffing to provide a clinical service. Our findings suggest that the value of clinical academic research posts  
39 538 for the service have not yet been realised and that the tension between ‘research’ and ‘clinical’ time still  
40  
41 539 exists. The development of a sustainable research culture requires dedicated research positions, protected  
42  
43 540 research time and a clinical academic career structure, which has proved challenging across international  
44 541 settings [44, 45]. Some organisations have shown that it is possible to develop bespoke solutions to ensure  
45  
46 542 career progression [46].

47  
48 543 The second theme of visibility revealed the role that individual research-active clinicians have in developing  
49  
50 544 research capability and motivating their clinical team. Areas without clinical academic role models may not  
51  
52 545 have the same level of exposure, or encouragement, to pursue research opportunities across the  
53 546 organisation. Without a personal connection to these activities, staff may perceive them as inaccessible.  
54  
55 547 Appropriate NMAHPP role models have previously been identified as enablers of research activity [47], and  
56  
57 548 interviewees in this study gave examples of where this had occurred. However, although interviewees  
58 549 suggested that research engagement should be captured through quantitative data on the number of  
59  
60 550 registered projects (audit, quality, improvement and research) and individuals involved in these projects, no

1  
2  
3 551 one mentioned using existing measures of research awareness/engagement such as research spider or  
4  
5 552 research culture and capacity survey, which have been reported in other NMAHPP clinical academic contexts  
6  
7 553 [48–50]. It is possible that measures of actual research activity held greater importance for interviewees  
8  
9 554 compared with more abstract measures of research knowledge and research intention; however, it is also  
10 555 possible that interviewees were not aware of the existing survey measures.

11  
12 556 Traditional research impact metrics, such as publications and presentations were highlighted by all  
13  
14 557 interviewees as a means of recording research outputs, however little value was attributed to these  
15  
16 558 activities in isolation. They appeared to be seen as a step towards the introduction of new evidence into  
17  
18 559 practice, while also contributing to the development of a positive reputation for the individual, their team,  
19 560 and the organisation as a whole. This aligns with the San Francisco Declaration on Research Assessment,  
20  
21 561 which calls for increased emphasis on research outputs, such as the creation of data sets and influence on  
22 562 policy and practice, instead of publication counts and journal Impact Factor [51].

23  
24  
25 563 When interviewees were asked about the value of different impacts, sustained opportunities to be involved  
26  
27 564 in research were highlighted as a factor that might improve staff recruitment and retention, and recruitment  
28 565 data was suggested as another method of capturing the impact of clinical academic activity. Similar views  
29  
30 566 have been reported elsewhere [38]. However, while research involvement was seen as a positive driver for  
31  
32 567 the workforce, the process of applying for and securing research funding was also seen as challenging for  
33 568 both individuals and teams. A recent mixed methods study of NMAHPP clinical academic careers  
34  
35 569 recommended investment in clinical academic roles to enable the continued utilisation of research-active  
36  
37 570 clinicians' skills and experience [47]. In our study, the clinical academic model for doctors was perceived as a  
38 571 clearer and more established pathway with dedicated clinical academic positions; however there were  
39  
40 572 concerns that it might not be appropriate, or possible, to directly emulate this pathway due to differences in  
41  
42 573 clinical roles and level of post-graduate clinical experience.

43  
44 574 We attempted to use an inclusive definition of healthcare professions outside medicine to reflect the clinical  
45  
46 575 academic strategy within the Trust. The term NMAHPP is not universally adopted and therefore we also used  
47 576 the description 'outside medicine'. This, along with similar terms, such as 'non-medical', may hinder the  
48  
49 577 establishment of a distinctive clinical academic identity for this broad group of clinicians. While there is  
50  
51 578 growing international interest in the development of sustainable NMAHPP clinical academic careers, current  
52 579 job descriptions and pathways vary and there are few substantive posts [46, 52]. A universally adopted term  
53  
54 580 to describe these clinicians, ideally without focussing on the fact that they are not clinical doctors, may aid  
55  
56 581 the collaborative development of these roles across the different professional disciplines.

57  
58 582 Comparison of the research impacts reported in the current study with those in existing frameworks  
59  
60 583 highlights interesting contextual differences. Key themes identified in a recent systematic review of

1  
2  
3 584 methodological frameworks for impact assessment in healthcare research focused on the macro level, for  
4  
5 585 example influence on policy making and health-related and societal impact [8]. In contrast, interviewees in  
6  
7 586 the current study gave their perspectives of the impacts of the clinical academic activity on the day-to-day  
8  
9 587 delivery of care and the skills and expertise available within their team/department. This may reflect the fact  
10 588 that most of our clinical academic interviewees were early career researchers and had not yet explored  
11  
12 589 impacts beyond the local context. It also illustrates how a broad range of relevant stakeholders will need to  
13 590 be involved in determining local, national or international assessments of research impact [10, 11]. Another  
14  
15 591 difference between our study and existing methodological frameworks was our exploration of the impact of  
16  
17 592 clinical academic activity, rather than research per se. For our interviewees, the process of NMAHPP  
18 593 clinicians getting to a position to be able to conduct research (i.e., securing funding and backfill), and the  
19  
20 594 impact of this on their team were also essential components, which needed to be repeated for each new  
21  
22 595 research study or fellowship.

23  
24 596 Our recent systematic review explored the impacts of NMAHPP clinical academic activity reported in the  
25  
26 597 literature and used the VICTOR framework to categorise the identified impacts [13]. Across all categories,  
27  
28 598 there were three recurring sub-themes: the challenges and benefits of balancing clinical and academic roles;  
29 599 creation and implementation of new evidence; and collaboration and networks. The first two of these sub-  
30  
31 600 themes were also reflected in the current study, suggesting that these are likely to be important features in  
32  
33 601 developing clinical academic careers and areas where impact could be assessed. We believe the ability to  
34 602 develop and utilise collaborations and networks is dependent on securing a clinical academic career  
35  
36 603 structure within individual organisations, and that investment is required to ensure that clinical academics  
37  
38 604 are in a position to progress beyond one-off fellowships. An ideal clinical academic pathway would include  
39 605 opportunities at all clinical grades, with common pathways available for all disciplines. This would enable  
40  
41 606 protected time for research, dissemination and implementation activities, reducing the need for short  
42  
43 607 periods of backfill, while developing future clinical and research leadership.

## 44 45 46 47 608 **Limitations**

48  
49 609 The current evaluation was conducted within a large, multi-site NHS organisation and an important  
50 610 limitation is that the findings may not represent different healthcare environments or geographical settings.  
51  
52 611 However, the comparison of our findings with the existing literature suggests that similar themes are likely  
53  
54 612 to be important elsewhere. Our study was not restricted to the evaluation of one specific type of research  
55 613 fellowship, or other intervention, and therefore reflects different clinical academic scenarios that occur  
56  
57 614 within the NHS. Clinical academic activity was defined as engagement in research alongside clinical practice  
58  
59 615 that was supported by additional funding. We acknowledge that other service development and quality

60

616 improvement activity occurs within the organisation, but we were guided by the Health Research  
617 Association definition of research, and therefore did not include activities defined by the former two  
618 categories [24].

619 It is possible that interviewees may have responded in a way that they felt was socially desirable, however  
620 steps were taken to facilitate open dialogue and explore both positive and negative aspects of clinical  
621 academic activity. Strategies included an interviewer who was not known to the interviewees in their clinical  
622 or research settings (they work clinically at a different NHS organisation), and the opportunity for  
623 interviewees to review their transcripts to ensure appropriate anonymity. Inviting interviewees to review  
624 their transcript and contribute to data interpretation does raise the potential issue that meanings expressed  
625 during the interviews may be modified as part of this process. In reality, member checking resulted in  
626 minimal changes to the written transcripts and instead provided additional context with interviewees  
627 clarifying meaning that aided data interpretation. Involvement of interviewees and the wider research-active  
628 community with the data analysis also appeared to contribute to the on-going development of research  
629 collegiality among NMAHPPs at the Trust.

630 The research team comprised clinical academics from nursing and physiotherapy. To ensure that study  
631 development was informed by a broader range of disciplines, interviewees and other research-active  
632 clinicians were included in pre-piloting and refining the interview schedule, reviewing and developing the  
633 Framework Analysis and resulting themes/sub-themes to minimise the influence of the study team.

634 It was interesting that the views of managers and research-active clinicians were well aligned. Previous  
635 research has identified non-facilitating managers at organisational and local levels as key barriers to the  
636 development of clinical academic opportunities [45, 53, 54], and this was a problem experienced by some of  
637 our clinical academics. However, interviewees were a self-selected population who responded to email  
638 invitations to discuss research activity and it is possible that the managers who participated held more  
639 positive views towards clinical academic activity than others within and outside the organisation. Managers  
640 and research-active clinicians were identified using a purposive sampling strategy aimed at including a  
641 breadth of different experiences (clinical discipline, academic level, clinical grade, hospital site). We did not  
642 include ethnicity as a sampling criterion, nor collect ethnicity data for participants, and acknowledge this as a  
643 limitation.

644 Due to the relatively small number of interviewees, we were unable to fully explore potential differences in  
645 views across different clinical disciplines, for example allied health professionals compared with nurses and  
646 midwives. However, during the analysis we deliberately looked for possible divergent views as a means of  
647 ensuring that our themes were fully representative of the data. We were unable to identify any clear

1  
2  
3 648 patterns, but larger samples, specifically designed to explore the question of divergent views, may uncover  
4  
5 649 important differences between professions.  
6  
7  
8

## 9 650 Conclusions

11 651 Perceived positive impacts of NMAHPP clinical academic activity focused on interlinked positive changes for  
12  
13 652 patients and clinical teams. The perception was that for patients, this included access to evidence-based  
14  
15 653 treatment and evidence-informed shared clinical decision-making. For clinical teams, this was experienced  
16  
17 654 through positive changes to the local research culture. The availability of, and support for, research  
18  
19 655 opportunities, were believed to improve staff recruitment and retention within research-active  
20  
21 656 departments. However, these impacts centred around individual research-active clinicians and did not  
22  
23 657 necessarily translate to all areas within the organisation. Moreover, the internal visibility of clinical  
24  
25 658 academics was often limited. The current clinical academic pathway was identified as creating challenges for  
26  
27 659 managers due to a tension between supporting externally funded research-time and having sufficient  
28  
29 660 staffing to cover the clinical service. Our findings suggest that the local impacts of clinical academic activity  
30  
31 661 are important to individuals and to the organisation, but that sustained investment and support are required  
32  
33 662 to ensure that research-active clinicians are able to realise the broad range of positive impacts identified  
34  
35 663 here. It is also important that mechanisms of capturing and recording different impacts are used, so that the  
36  
37 664 value of clinical academic activity is visible.  
38

## 37 665 Contributorship statement

39 666 All authors contributed to the study conception and design. LN conducted the interviews, led the analysis  
40  
41 667 and drafted the manuscript. CA and MW provided input to the analysis, agreed the final themes and  
42  
43 668 contributed to the content of the manuscript. All authors have approved the final manuscript.  
44  
45

## 46 669 Competing interests

47  
48 670 The authors declare no potential conflicts of interest with respect to the research authorship, and/or  
49  
50 671 publication of this article.  
51

## 52 672 Funding

53 673 This study was funded by the NIHR Imperial Biomedical Research Centre (BRC) (reference P79998). The  
54  
55 674 views expressed are those of the authors and not necessarily those of the NIHR or the Department of Health  
56  
57 675 and Social Care.  
58  
59  
60

## Data sharing statement

The study protocol is available from the OSF repository: DOI 10.17605/OSF.IO/P8HYD. Participants did not provide consent for open access publication of their interview transcripts. These data are available on reasonable request and subject to informed consent from the study interviewees.

## Ethics approval

Approval was granted by Imperial College Healthcare NHS Trust Clinical Audit and Service Evaluation Team (reference: 418). The study was exempt from NHS ethics approval because interviewees were recruited by virtue of their professional role.

## Informed consent

Written informed consent was obtained from the participants for their anonymised information to be published in this article, including direct quotes.

## Acknowledgements

The authors wish to thank and acknowledge all participants for giving up their time to be interviewed. Thank you also to the participants and members of the Imperial College Healthcare NHS Trust Postgraduate Research Forum for their helpful feedback and contribution to the development of the reported themes.

## Positive impacts

### Theme 1: Cultural shifts

- Approach to patient care
- Research Culture

### Theme 2: Visibility

- Positive reputation

### Theme 3: Clinical academic pathways

- Best of both worlds

## Opportunities

### Theme 3: Clinical academic pathways

- Development of common pathways for NMAHPPs
- Not necessarily replicating the medical clinical academic model
- Appropriate opportunities for all clinical grades
- Protected time for research
- Establish research leadership

## Making impact tangible

### Direct research outputs

- Publications
- Conference presentations
- Implementation of research

### Indirect research outputs

- Guideline development
- Involvement in professional bodies
- Financial income
- Peer reviewing
- Shared learning with clinical team

### Workforce impacts

- Recruitment
- Retention
- Staff involved in research

### Impacts to patients

- Feedback
- Clinical outcomes

## Challenges

### Theme 2: Visibility

- Invisibility and inaccessibility

### Theme 3: Clinical academic pathways

- Applying for research funding
- When the funding ends
- Backfill chain
- Context of the medical research model

Date \_\_\_ / \_\_\_ / \_\_\_

## Interview Topic Guide – Clinical Academic

### Pre-interview

Consent form complete Check agree to audio recording Assure confidentiality 

Confirm time available for interview \_\_\_\_\_

### Introduction

Aims of the whole service evaluation: explore clinical academic activity among non-medics at the Trust and how we can record the impact of this activity.

Aims of this interview are to find out about your experiences and any suggestions you have for this project.

### Demographic information

#### Primary hospital site

 St Mary's Hospital Hammersmith Hospital Charing Cross Hospital Western Eye Hospital Queen Charlotte's and Chelsea Hospital

Other \_\_\_\_\_

NHS band \_\_\_\_\_

Year of clinical qualification \_\_\_\_\_

#### Clinical discipline

 Nurse Art, drama or music therapist Midwife Clinical research practitioner Dietitian Clinical psychologists Occupational therapist Healthcare scientists Orthoptist Pharmacists Operating department practitioner Osteopath
 Assistant, technician or  
associate of any of these professions (also  
tick relevant professions)
 Podiatrist Prosthetist/orthotist Paramedic Other \_\_\_\_\_ Physiotherapist Radiographer Speech and language therapist

Clinical specialty \_\_\_\_\_

Research fellowships / funding \_\_\_\_\_

What does this fellowship/funding mean for you?

1. Can I start by asking: what your role involves day to day?

*Prompts*

*Clinical v academic activities – are these integrated or separate?*

*Is securing fellowship/research funding or part of role?*

*Management*

*Responsibility for supervising others*

*Education*

*Career aspirations*

*What about after your fellowship?*

2. What does the term clinical academic mean to you?

*Follow up:*

*Do you see yourself as a clinical academic?*

*If not, why not? And what might a clinical academic role look like to you*

*What do you see as the difference between a clinical academic and an academic?*

3. What do you think the role of clinical academics should be within:

a) A local team, for example within your team

b) The wider department

c) Across the whole Trust

*Prompts*

*What do you think are the benefits of these types of role?*

4. How would you summarise your research activity at the Trust?

*Prompts*

*Focus – clinical care/intervention, patient journey, experience*

*How did you decide this was something you wanted to be involved with?*

*Other clinical academic activities e.g. teaching / research support*

5. Do you feel like your perspectives have changed as a result of your research involvement?

*Prompts*

*Approach to delivering clinical care*

*Approach to reviewing/appraising the evidence-base*

*Has it changed how you feel about your work?*

*Any change to how you see your career developing?*

*Are there any activities you are now involved in as a result of your research/fellowship that might not have been possible otherwise?*

6. What do you think are/have been/will be the impacts of your clinical academic activity?

*Prompts*

*On patients – clinical care, pathways, experience, satisfaction*

*On clinical team – have others become involved in research, clinical understanding, time management, project management, presentation skills, any cross over skill?*

*To the Trust – staffing*

*Outside the Trust – reputation, wider implication of change in practice*

7. Are there any factors that were particularly helpful for you in generating these impacts?

*Prompts*

*Protected time after fellowship*

*Funding – publications, conferences etc*

1  
2 8. Have you experienced any obstacles to creating impact from your research?

3 *Prompts*

4 *Protected time after fellowship*

5 *Funding – publications, conferences etc*

6 *Any differences between the opportunities for medical and non-medical HCPs*

7  
8  
9 9. Where do you see yourself in 5-10 years time?

10 *Prompts*

11 *Role – clinical/academic etc.*

12 *Locations*

13 *Goals*

14  
15  
16 10. How do you think we can best capture and report the impact of our clinical academic activity?

17 *Prompts*

18 *Discuss numerical versus qualitative/experiential data*

19 *What type of data do you think hospital managers are looking for?*

20 *What type of data do you think the NHS are/should be looking for nationally?*

21 *Impact assessment tools/ standardised assessment measures*

22 *Timescales of impacts – when to collect the impact data?*

23  
24  
25  
26 11. Which of these elements of impact do you think should be most important for the Trust?

27  
28 *Prioritisation activity using existing impact tool, plus anything else mentioned by interviewee above:*

29 *Highlight the measures/questions you think are most important*

30 *Prompt for top 3 measures of impact and reasoning for choices*

31 *Are there any that you really don't think would be important for the Trust?*

32 *How do you think this might be different for medics versus non-medics research?*

33  
34  
35  
36 12. Is there anything else you would like to discuss regarding clinical academic activity?

37  
38 13. Do you have any questions you would like to ask me?

39  
40 14. Is there anyone else in the Trust you think it would be particularly useful for me to speak to?

41  
42  
43 **Post-interview**

44 Thank interviewee for their time

45 Assure confidentiality – discuss interview/transcripts in batches

46 Inform re transcript check, if applicable

Date \_\_\_ / \_\_\_ / \_\_\_

Interview code \_\_\_\_\_

## Interview Topic Guide – Manager

### Pre-interview

Consent form complete Check agree to audio recording Assure confidentiality 

Confirm time available for interview \_\_\_\_\_

### Introduction

Aims of the whole service evaluation: explore clinical academic activity among non-medics at the Trust and how we can record the impact of this activity.

Aims of interview: find out about your views and experiences as a manager of non-medical healthcare professionals

### Demographic information

#### Primary hospital site

 St Mary's Hospital  Hammersmith Hospital

 Charing Cross Hospital  Western Eye Hospital

 Queen Charlotte's and Chelsea Hospital

Other \_\_\_\_\_

NHS band \_\_\_\_\_

Clinical discipline (own background) \_\_\_\_\_

#### Discipline(s) of those responsible for:

 Nurse

 Midwife

 Clinical psychologists

 Healthcare scientists

 Pharmacists

 Assistant, technician or associate of any of these professions (also tick relevant professions)

 Other \_\_\_\_\_

 Art, drama or music therapist

 Clinical research practitioner

 Dietitian

 Occupational therapist

 Orthoptist

 Operating department practitioner

 Osteopath

 Podiatrist

 Prosthetist/orthotist

 Paramedic

 Physiotherapist

 Radiographer

 Speech and language therapist

Clinical area /specialty \_\_\_\_\_

1  
2  
3 15. First, can I start by asking: what your role involves day to day?

4 *Prompts*

5 *Any clinical duties*

6 *Any involvement in research, service evaluation, audit*

7 *Who are you responsible to – in terms of the management structure, rather than individual names*

8  
9  
10 16. Have you received any funding or dedicated time for research as part of your career?

11 *If not, is this something you would have liked? – why?*

12 *If yes, what did this mean to you?*

13  
14  
15 17. What does the term clinical academic mean to you?

16 *Follow up:*

17 *Do you have any individuals you would describe as clinical academics in your team?*

18 *What about their role makes them a clinical academic?*

19  
20  
21 18. Thinking generally, what do you think the role of clinical academics should be within their:

22 d) Local team

23 e) Wider department

24 f) Trust

25  
26  
27 19. How do you think clinical academic roles might be supported within the NHS?

28 *Prompts*

29 *Career structure*

30 *Roles and responsibilities*

31  
32  
33 20. What is your experience of managing team members involved in any type of clinical research activity?

34 *Prompts*

35 *Types of research activity*

36 *Managing backfill and recruitment*

37 *Managing service delivery*

38 *Role of the clinician within the team e.g. during a research fellowship*

39 *Impact of the clinical academic activity on the wider team*

40 *Any impacts to patient care*

41 *Dissemination activities – writing for publication, presenting at conferences*

42  
43  
44  
45 21. What differences have these individuals made to your team?

46 *Prompts*

47 *During the research*

48 *After the research was finished // or what differences do you anticipate after the research is finished*

49 *Impacts to patients*

50 *Impacts to different team members*

51 *Impact to the individual*

52 *Positives and negatives*

53  
54  
55  
56 *If no experience:*

57 What do you anticipate might be the differences to your team if you were supporting a clinical academic  
58 within your service?

59 *Prompts*

*Backfill and recruitment*

*Service delivery*

*Role of the clinician within the team during research time*

*Impact of the clinical academic activity on the wider team*

*Any impacts to patient care*

*Dissemination activities – writing for publication, presenting at conferences*

*Differences both during and after their research project*

22. Thinking broadly, what do you think are the impacts of clinical academic activity at the Trust?

*Prompt positives and negatives for the:*

*Team*

*Patients*

*Individual*

*Trust*

*Professional discipline / other non-medical professions*

23. How do you think we can best capture these impacts?

*Focus on interviewees ideas initially*

*Prompt numerical data*

*Prompt qualitative/experiential data – how do they think we could capture the value*

*Proceed to discuss contents of existing research impact frameworks/tools*

*Based around the VICTOR tool, which has 6 domains:*

*Health benefits, safety & quality improvements during the study*

*Service and work force impacts*

*Research profile of the organisation and research capacity*

*Economic impacts*

*Organisation's influence and reputation*

*Knowledge generation and knowledge exchange*

24. What measures of impact do you think should be most important for the Trust?

*Prioritisation activity using existing impact tool, plus anything else mentioned by interviewee above:*

*Prompt for top 3 measures of impact and reasoning*

*Are there any that you don't think would be important for the Trust?*

25. Is there anything else you would like to discuss regarding clinical academic activity?

26. Do you have any questions you would like to ask me?

27. Is there anyone else in the Trust you think it would be particularly useful for me to speak to?

#### Post-interview

Thank interviewee for their time

Assure confidentiality – discuss interview/transcripts in batches

Inform re transcript check, if applicable

## Impact of non-medical clinical academics at Imperial College Healthcare NHS Trust (ICHT) – Information for participants

Thank you for your interest in our service evaluation exploring the impact of clinical academic activity among non-medical healthcare professionals. Key information about the project is outlined below. If you have any questions, or would like any additional information, please email Lisa Newington on [l.newington@imperial.ac.uk](mailto:l.newington@imperial.ac.uk).

### Why are we carrying this service evaluation?

In 2018 a 5-year strategic plan was launched at ICHT to promote clinical academic activity among healthcare professionals outside medicine. The aims of the plan, entitled 'Research is Everyone's Business' were to increase research capacity and capability across these professional groups and to enhance the quality and relevance of research outputs to improve patient care. An additional aim was for ICHT to be seen as a leading NHS trust for clinical academic careers. This service evaluation has been developed to assess the perceived impact of clinical academic activity across non-medical healthcare professionals within ICHT. The findings will be used to develop a specific impact assessment framework that will enable the standardised capture of clinical academic research impact in the future.

### Who is eligible to be involved?

We would like to speak to healthcare professionals of any grade who have been involved in clinical research at any level. This evaluation only includes non-medical professions, for example: nurses; midwives; allied health professionals (art therapists, dietitians, drama therapists, music therapists, occupational therapists, orthoptists, operating department practitioners, osteopaths, podiatrists, prosthetists/orthotists, paramedics, physiotherapists, radiographers, and speech and language therapists); clinical psychologists; healthcare scientists and pharmacists. Assistants, technicians and support workers within these disciplines are also invited to take part. We would also like to be speak to service managers for these professions.

### Who is in the service evaluation team?

The evaluation is being led by Lisa Newington, with support from Caroline Alexander and Mary Wells. Contact details are provided at the end of this information sheet. A small number of research fellows and clinical students may also be involved in anonymised stages of the analysis, to provide an opportunity for their learning and development. Their involvement will be supervised and monitored by the service evaluation team.

### What will the interview involve?

The interview will be a one-off discussion with Lisa Newington. This will be guided by questions about your experience of being involved in clinical research, how you think clinical academic activity can be supported within the Trust and how we could/should measure the impact of this activity. The interview will be audio recorded to allow a qualitative analysis of the key themes across all interviews. If you would prefer to be interviewed with a colleague or colleagues, this can be accommodated. Interviews will be arranged at a time and location that is convenient for you and are anticipated to take 30-45 minutes. You will be given the opportunity to review the

interview text once it is transcribed, and to provide feedback on the initial analysis. It is up to you whether or not you wish to be involved in these steps.

#### Will my contribution be anonymous?

The recorded interview will be transcribed by an external company who are bound by a confidentiality agreement. Transcripts will be filed using an anonymous reference code. Identifiable data (your name and clinical specialty) will be logged separately. The project report for ICHT will include illustrative quotes to support the themes identified. It may be helpful to include participant names and clinical speciality in support of existing clinical activity, however these details will not be included without your expressed permission for the particular quote and in the specific context. Any journal publications that result from this project will not include any identifiable information.

#### Who has approved this project?

This service evaluation has been approved by the Imperial College Healthcare NHS Trust audit office ([imperial.audit@nhs.net](mailto:imperial.audit@nhs.net); reference 418). The project is funded by NIHR Imperial Biomedical Research Centre (BRC).

#### What if I no longer wish to be involved?

You can request for your interview to be removed from this project for 21 days after the interview, at which point the audio file and transcript will be deleted. After this time, the anonymous transcripts will have been incorporated into the analysis and it will not be possible to remove individual components. Before 01/08/2020, you can still request that no quotes from your interview are used in the final reports. Please email [l.newington@imperial.ac.uk](mailto:l.newington@imperial.ac.uk) if you wish to make either of these requests.

#### Who should I contact if I have a complaint about the project?

Please speak to one of the service evaluation team in the first instant using the contact details below. Alternatively, you can contact the Trust audit office on 0203 312 2460 or [imperial.audit@nhs.net](mailto:imperial.audit@nhs.net).

Thank you for your interest in our service evaluation!

## COREQ Checklist

Item	Guide questions	Response	Section
<b>Domain 1: Research team and reflexivity</b>			
<b>Personal characteristics</b>			
<i>Interviewer</i>	Which author conducted the interviews?	Lead author	Methods: participants and recruitment, p4
<i>Credentials</i>	What were the researcher's credentials?	Post-doctoral researcher	Methods: design and approvals, p3
<i>Occupation</i>	What was their occupation at the time of the study?	Physiotherapist	Methods: design and approvals, p3
<i>Gender</i>	Was the researcher male or female?	Female	Author names
<i>Experience and training</i>	What experience or training did the researcher have?	Previous qualitative experience	Methods: design and approvals, p3
<b>Relationship with participants</b>			
<i>Relationship established</i>	Was a relationship established prior to study commencement?	Research team and interviewees were based within the same healthcare organisation. Interviewees were not known to the lead author in clinical/research capacity	Methods: study design and approvals, p3 Discussion: limitations, p22
<i>Participant knowledge of the interview</i>	What did participants know about the research?	A participant information sheet was provided prior to involvement in the service evaluation	Methods: participants and recruitment, p4
<i>Interviewer characteristics</i>	What characteristics were reported about the interviewer?	Background research and clinical positions discussed	Methods: design and approvals, p3
<b>Domain 2: Study design</b>			
<b>Theoretical framework</b>			
Methodological orientation and theory	What methodological orientation was stated to underpin the study?	Qualitative service evaluation	Methods: design and approvals, p3
<b>Participant selection</b>			
Sampling	How were participants selected?	Purposive sampling strategy, criteria are reported	Methods: participants and recruitment, p4
Method of approach	How were participants approached?	By invitation email and provision of the participant information sheet.	Methods: participants and recruitment, p4
Sample size	How many participants were in the study?	20	Results: participants, p6 Table 1

Item	Guide questions	Response	Section
Non-participation	How many people refused to participate or dropped out? Reasons?	8 individuals did not respond to the invitation email. None of the participants dropped out	Table 1
<b>Setting</b>			
Setting of data collection	Where was the data collected?	A combination of face-to-face, video and telephone interview. One interview was also completed by email	Table 1
Presence of non-participants	Was anyone else present beside participants and researchers?	No additional people were present for the face-to-face interviews. Interviewees were asked to find a private place where they were comfortable to talk for the video and phone interviews	
Description of sample	What are the important characteristics of the sample	Demographic and key occupational characteristics are reported	Table 1
<b>Data collection</b>			
Interview guide	Were questions, prompts, guides provided by the authors? Was it pilot tested?	A pre-piloted interview schedule, including questions and prompts, was used throughout	Methods: design and approvals, p3 Additional file
Repeat interviews	Were repeat interviews carried out? If so, how many?	No repeat interviews were performed	Methods: design and approvals, p3 Table 1
Audio / visual recording	How did the researchers record the data?	Interviews were audio recorded and one was completed by email	Methods: participants and recruitment, p4
Field notes	Were field notes made during and/or after the interview?	Notes were made during and after the interviews and were recorded in the interview log	Methods: participants and recruitment, p4
Duration	What was the duration of the interviews?	Interview durations are reported	Table 1
Data saturation	Was data saturation discussed?	Data saturation was defined in advance and used to guide the number of interviews	Methods: participants and recruitment, p4
Transcripts returned	Were transcripts returned to participants for comment/correction?	Transcripts were reviewed by the lead author and compared with the audio file. Transcripts were returned to participants for checking, where this option was selected on their consent form	Methods: analysis, p4
<b>Domain 3: Analysis and findings</b>			
<b>Data analysis</b>			
Number of data coders	How many data coders coded the data?	Three researchers coded the initial two transcripts to develop the coding frame. Subsequent transcripts were coded by the lead author and reviewed by the research team	Methods: analysis, p4

## Impacts of clinical academic activity

Newington et al. 2021

Item	Guide questions	Response	Section
Data coding tree	Did authors provide a description of the data coding tree?	The process of forming the coding framework is discussed	Methods: analysis, p4
Derivation of themes	Were themes identified in advance or derived from the data?	Themes were derived from the data	Methods: analysis, p4
Software	What software was used to manage the data?	NVivo	Methods: analysis, p4
Participant checking	Did participants provide feedback on the findings?	Feedback was provided by nine interviewees who review the preliminary analysis and contributed to the final version	Methods: analysis, p4
<b>Reporting</b>			
Quotations presented	Were participant quotations presented to illustrate themes? Was each quotation identified?	Quotations were provided for all themes and were identified by the interviewee's code	Results, p6-18 Table 2
Data and findings consistent	Was there consistency between the data presented and the findings?	The themes were reflective of the quotations. The conclusions were reflective of the data	Results and discussion
Clarity of major themes	Were major themes clearly presented in the findings?	The identified themes were described in the data and presented visually as a figure	Results, p6-18 Figure 1
Clarity of minor themes	Is there a description of diverse cases or discussion of minor themes?	Diverse cases were discussed within the sub-themes	Results: p6-18
