ABSTRACT

Introduction Insomnia is a prevalent sleep disorder that causes substantial personal and societal harm. There is evidence that placebo interventions can reduce insomnia symptoms, but this research has involved deceptively administering the placebo under the guise of a real medication (conventional placebo, CP), which has obvious ethical constraints. Open-label placebo (OLP) treatment, in which a placebo is administered with full disclosure that there are no active ingredients, has been proposed as a method of using the placebo effect ethically, but the efficacy and acceptability of OLP for insomnia is currently unknown.

Methods and analysis This study uses a cohort multiple randomised controlled trial design to compare OLP, CP and no treatment for insomnia. Two-hundred and sixty-seven participants with self-reported insomnia symptoms (Insomnia Severity Index, ISI ≥ 10) will be recruited into an observational study and have their sleep monitored over a 2-week period. Participants will then be randomised to one of three groups: invite to OLP, invite to CP described deceptively as a new pharmacological agent, or no invite/observational control. Those in OLP and CP accepting the invite receive identical placebos for a 2-week treatment period while sleep is monitored in all participants. The primary outcome is ISI at the end of the treatment period. Secondary outcomes include treatment uptake and clinically significant response rates, objective and subjective sleep parameters, fatigue, mood, expectancy, treatment satisfaction and side effects. Predictors of uptake and responses to OLP and CP will be explored.

Ethics and dissemination The trial has been approved by The University of Sydney Human Research Ethics Committee. Written informed consent is obtained from every participant. OLP and CP participants accepting the invite undergo an additional consent process. Results will be disseminated via peer-reviewed conference proceedings and publications.

Trial registration number ACTRN12620001080910.

INTRODUCTION

Insomnia is the most common sleep disorder, with an estimated diagnostic prevalence of 10%^{1–3} and symptom prevalence of 30%^{3,4} in adults. Higher prevalence rates have been reported in medical settings, ranging from 20% to 56%,^{2–6} with up to 90% of patients

Strengths and limitations of this study

- This will be the first study to test whether open-label placebo (OLP) is effective and acceptable for insomnia.
- The use of a cohort multiple randomised controlled trial design provides a more ecologically valid no treatment comparison and will allow us to compare the efficacy and uptake of OLP relative to conventional placebo.
- The inclusion of actigraphy means that we can assess the effect of OLP on both self-report and objective sleep outcomes.
- Predictors of uptake and any resulting placebo effect will be explored, including expectancy and baseline insomnia severity.
- Because of the nature of the study, participants and researchers cannot be blind to treatment allocation, but the data analysis will be conducted by a blind researcher.

being prescribed pharmacotherapy.^{7–8} Insomnia is characterised by difficulty initiating or maintaining sleep along with daytime impairment and/or distress and carries substantial personal and socioeconomic burden.^{9,10} People with insomnia have poorer quality of life, greater risk of experiencing other medical conditions and psychiatric disorders, increased healthcare utilisation and reduced work productivity.^{11–13} While a range of pharmacological treatments are available for insomnia, those that demonstrate efficacy are associated with significant risks in terms of adverse effects and the potential for dependence (eg, benzodiazepines),¹⁴ whereas those with lower risk profiles have limited efficacy (eg, melatonin).¹⁵ Cognitive-behavioural therapy for insomnia (CBT-I) has been recommended as first line treatment for insomnia,^{2,3} however, CBT-I is not always accessible³ and both practitioners and people with insomnia appear more willing to persist with pharmacological rather than psychological interventions.^{6,8,16,17} As such,

there remains a pressing need to identify safe and effective treatments to combat the burden of insomnia.

Interestingly, many randomised placebo-controlled trials of insomnia interventions find that participants allocated to placebo treatment experience significant improvement.^{18–20} This suggests that insomnia may be responsive to the placebo effect, whereby the treatment context itself elicits positive expectancies that trigger improvement.^{21–23} Importantly, improvement in placebo groups of these trials holds even when directly compared with no treatment,²⁴ indicating that placebo treatment generates more improvement in insomnia than can be accounted for by other factors, such as, spontaneous recovery and regression to the mean.²⁵ Therefore, it may be possible to harness the placebo effect to reduce the burden of insomnia.

Placebo interventions likely carry fewer adverse events than pharmacological interventions and have lower cost than psychological interventions.²⁶ On the other hand, the deception typically associated with placebo administration presents a significant barrier to its clinical use because of the violation of patient trust and informed consent.²⁷ However, this barrier is based on the assumption that deception is necessary to elicit a placebo effect, which has recently been called into question by ‘open-label placebo’ (OLP) trials.²⁸

OLP trials involve administering placebo treatment with full disclosure that the treatment is in fact a placebo, meaning there is no deception. Only a handful of randomised controlled trials (RCTs) testing OLP have been conducted to date and none with insomnia, but the available data suggest some promising results. For example, in an RCT comparing 3 weeks of OLP with ‘treatment as usual’ (TAU) for chronic pain, Carvalho *et al*²⁹ found that OLP significantly reduced pain and disability, with moderate to large effect sizes. Similar results have been found in RCTs of OLP for irritable bowel syndrome,³⁰ depression³¹ and allergic rhinovirus.³² As a result, there have been increasing calls to explore the potential efficacy of OLP in clinical practice.^{28 33}

Despite the promising preliminary findings, several criticisms of existing OLP trials have been raised. The most common criticism concerns the types of control group used, typically TAU or waitlist control. The very nature of OLP treatment means that participants and researchers are not blind to treatment allocation, potentially introducing problems with demand characteristics and experimenter bias.²⁸ While that may be difficult to avoid, a further problem is that knowingly being allocated to receive no treatment may induce nocebo effects and thereby poorer outcomes in the control group, artificially inflating the apparent efficacy of OLP treatment.^{28 34} In addition to concerns regarding the type of control groups used, a second potential important limitation is that participants in OLP trials are usually recruited via advertisements explicitly describing the intervention as a ‘novel mind–body treatment’.^{29 30} Little is known about the characteristics of individuals who volunteer to participate in

‘novel mind–body treatment’ research, but differences between such samples and the general population could significantly limit the generalisability of existing OLP trials. If only those who already hold strong beliefs about the power of the mind are enrolled, then this could overestimate the efficacy of OLP effects in the general population. A final limitation is that existing OLP trials have failed to include a comparison with conventional (deceptive) placebo (CP) treatment, which is important to evaluate the relative cost–benefit of OLP versus CP.

To address this, the current study tests the efficacy of OLP for insomnia (OPIN) using a novel cohort multiple RCT (cmRCT) design comparing OLP, CP and no treatment. The cmRCT involves a two-stage consent process whereby participants are first recruited to an observational study (with no mention of intervention) and are then randomised to be invited to the treatment arms or to remain in the observational arm (ie, act as controls).³⁵ This design allows us to compare the efficacy and uptake of OLP versus CP, relative to a no treatment group, in a more generalisable sample of participants not specifically interested in mind–body treatments, and in a scenario whereby participants in the control group are unaware they are missing out on a potentially desirable treatment. The protocol and study design are guided by the recommendations set out in the Standard Protocol Items: Recommendations for Interventional Trials (SPIRIT) 2013 Statement.³⁶ The results will provide first ever evidence concerning whether OLP is an effective treatment for insomnia and the strongest test of OLP effects in general to date.

Objectives

Primary objective

- Determine whether OLP is associated with reductions in self-report insomnia symptoms, measured by the Insomnia Severity Index (ISI), compared with CP and no treatment.

Secondary objectives

- Determine whether OLP is associated with improvements in objective and subjective sleep parameters, daytime fatigue, depression, anxiety, stress, expectancy, treatment satisfaction and side effects, relative to CP and no treatment.
- Determine whether OLP is associated with clinically significant improvements in insomnia (response rate), relative to CP and no treatment.
- Determine the rate of uptake of OLP relative to CP.
- Identify which demographic, individual, and clinical characteristics predict uptake and the placebo effect (as measured on ISI scores, number of respondents etc.) following OLP and CP.

METHOD AND ANALYSIS

Trial design

As shown in figure 1, the OPIN trial will use a parallel three-arm cmRCT design³⁵ comparing OLP, CP and no

Figure 1 Trial design and flow chart. BFI, Big-Five Inventory; DASS-21, Depression Anxiety Stress Scales; FSI, Fatigue Symptom Inventory; GASE, Generic Assessment of Side Effects; ISI, Insomnia Severity Index; LOT-R, Life Orientation Test-Revised; TSQM-II, Treatment Satisfaction Questionnaire for Medication-Version II.

treatment/observational control (OC) for insomnia. In the first stage, a cohort of participants with self-reported insomnia symptoms will be recruited into a 2-week observational (baseline) period. In the second stage, participants will be randomised to one of three groups: invite to OLP, invite to CP or no invite/OC. OLP will be openly described as consisting of no active ingredient and instead aiming to capitalise on the placebo effect. CP will be described as a new pharmacological agent designed to promote sleep. Participants consenting to OLP or CP will be administered placebo medication, while those allocated to OC will continue to be observed for the 2-week treatment period.

The study Steering Committee (principal investigator (PI), associate investigators, study coordinator and statistician) will meet every 6 months to review the study, ensuring adherence to all ethical, regulatory and clinical trial guidelines. If higher-than-anticipated attrition rates occur, the Steering Committee will investigate whether the sample size needs to be increased to maintain power,

and if so, will seek the appropriate modifications. A Data Monitoring Committee will not be implemented because all participants receive placebos and adverse events are anticipated to be low. Although early study termination is unanticipated, if deemed necessary, only the PI will have the authority to terminate the study.

Participants

To be eligible, participants must report an ISI ≥ 10 , be at least 18 years old, be proficient in English and be able to attend the study site three times over 1 month. The following exclusion criteria will apply: (1) sleep disorder other than insomnia, (2) currently pregnant, planning to conceive in the next 3 months, breast feeding or <1 year post partum, (3) serious medical illness requiring invasive treatment/surgery (eg, cancer) or heavy substance use, (4) severe psychiatric comorbidity (eg, psychosis, bipolar disorder, depression) or risk of self-harm or suicidality, (5) currently receiving psychological treatment or taking regular (ie, $\geq 1/\text{week}$) medication for sleep (including prescription or over-the-counter medications, herbal supplements, homeopathic preparations), (6) undertaking shift work (fixed or rotating, including regular night shifts), and/or (7) intending to travel to a destination >2 hours' time difference in the next 3 months. An ISI score of ≥ 10 was chosen because it has been suggested to indicate clinically significant insomnia,³⁷ with high sensitivity and specificity in community samples,³⁸ and is frequently used in RCTs of sleep interventions.^{39 40} Participants will be reimbursed \$A60 upon completion of the study and will be provided with 12 months free access to SleepioTM, a commercially available digital CBT app found to reduce insomnia symptoms.⁴¹

Study setting

The study will take place at The University of Sydney, Australia. The study will be advertised online (eg, university research volunteer sites, Facebook) with a link to the study website. The study website includes information about the observational component of the study, researcher contact details, the information sheet and consent form, and a link to complete the online screening measures. Eligible and consenting participants will be contacted and invited to attend the study site to commence participation.

Materials and measures

Placebo capsules

Participants in the OLP and CP arms will receive a bottle containing identical 28 blue and white plant-based capsules containing microcrystalline cellulose. Bottles for the OLP and CP treatment arms will be labelled 'Open-label Placebo Capsules' and '(Codename) Capsules' (the codename is a 7-digit alphanumeric sequence that will be the same for all participants allocated to CP, however, is omitted here to avoid the protocol appearing in any internet searches participants may undertake), respectively.

Primary outcome

*ISI.*³⁷ The ISI is a brief, validated 7-item self-report questionnaire assessing insomnia symptomatology on a 5-point scale. Items addressed include the severity of sleep onset, maintenance and early awakening difficulties in the last 2 weeks and are rated from 0='none' to 4='very severe'. Other items rate sleep dissatisfaction, distress, interference and noticeability to others. Scores are summed to obtain a total score from 0 to 28, with the following clinical cut-offs: no clinically significant insomnia (0–7), subthreshold insomnia (8–14), moderate insomnia (15–21) and severe insomnia (22–28). The ISI is a reliable and valid measure in clinical and research settings, with sound internal consistency coefficients (0.74–0.78), and moderate concurrent validity (0.32–0.91) between the ISI and daily sleep diary.³⁷

Secondary outcomes

Uptake of OLP and CP. Uptake of OLP and CP will be measured simply as the proportion of participants accepting the invite to each treatment arm.

Response rate. Clinically significant improvements in insomnia will be defined as the rate of participants obtaining a 6-point or greater reduction on the ISI from baseline to post-treatment⁴² and/or who have an ISI score below the cut-off of 10 at post-treatment,³⁸ relative to CP and no treatment.

Actigraphy. Objective sleep-wake data will be calculated from actigraphy watches (GENEActive, Activinsights, Cambridgeshire, UK). These are small, wrist-worn accelerometers that record daily movement and can be used to calculate a range of objective sleep parameters. Actigraphy watches have established validity against gold standard sleep assessment (ie, polysomnography).⁴³ Actigraphy data will be used to calculate objective sleep parameters including sleep onset latency, total sleep duration and overall sleep quality.

*Consensus sleep diary (CSD).*⁴⁴ The CSD is widely used to assess participants' self-reported sleep patterns. The CSD includes questions about time in bed, time to sleep, and number and duration of awakenings. As a measure of treatment adherence, OLP and CP participants will complete items asking whether, and when, they took the capsules the previous night.

*Fatigue Symptom Inventory (FSI).*⁴⁵ The FSI is a 14-item self-report inventory assessing the intensity, duration, impact and daily pattern of fatigue over a 1-week period. Participants rate their fatigue from 0='no fatigue' to 10='the most fatigue' with respect to severity, duration and interference. Individual items are scored to assess least, most and average fatigue in the past week, and current fatigue. Severity items can be averaged to obtain a composite FSI score.⁴⁶ Items addressing fatigue interference with daily functioning or psychosocial well-being are averaged to obtain an interference scale score.⁴⁷ The FSI has good internal consistency (0.91–0.96), and demonstrated concurrent, convergent and discriminant validity.⁴⁷

*Depression Anxiety Stress Scales (DASS-21).*⁴⁸ The DASS-21 is a 21-item self-report measure consisting of three 7-item scales measuring symptoms of depression, anxiety and stress. Each item is rated on a scale from 0='did not apply to me at all' to 4='applied to me very much, or most of the time'. Item scores are summed and multiplied by two to calculate a final score ranging from 0 to 42 for each scale. Psychometric properties indicate adequate construct validity and excellent internal consistency for the depression (0.88), anxiety (0.82) and stress (0.90) scales.⁴⁹

Expectancy measure. A purpose-built expectancy measure was developed for this study. All participants are asked how much they expect their insomnia symptoms to change as a result of taking part of the study at two time points: prior to the 2-week baseline period and prior to the 2-week treatment period (after randomisation). Responses are completed on a scale from -10='much worse' through 0='no change' to 10='much better'.

*Generic Assessment of Side Effects (GASE).*⁵⁰ The GASE is a standardised self-report measure of 36 commonly reported side effects observed in clinical trials (eg, headache, dry mouth). Participants rate the intensity of these symptoms from 0='not present' to 3='severe' and indicate whether each symptom is related to their treatment. The intensity ratings are summed to obtain a total GASE score and a medication-attributed score is calculated by summing symptom scores rated as related to treatment.⁵⁰ Because OC does not receive any medication, an amended version of the attribution question will be administered, whereby for any symptoms present participants in all three arms (OLP, CP and OC) indicate whether each symptom is related to study participation first, then only those participants in the OLP and CP arms indicate whether they believe any such symptom is related to the study medication.

*Treatment Satisfaction Questionnaire for Medication-Version II (TSQM-II).*⁵¹ The TSQM-II is an 11-item self-report measure of participants' perceived effectiveness, convenience, side effects and overall satisfaction with medication use. The measure will be administered specifically to participants enrolled in the OLP or CP arms because it focuses on treatment/medication. Domain items are summed and then transformed to a composite score ranging from 0 to 100. The TSQM-II has demonstrated construct validity and internal consistency coefficients ranging from 0.88 to 0.94 across domains.^{51 52}

Potential predictors of uptake and the placebo effect

In addition to demographic data, the following personality and clinical history measures will be administered as part of the online screening measures completed prior to study enrolment.

*Life Orientation Test-Revised (LOT-R).*⁵³ The LOT-R is a 10-item measure assessing dispositional optimism. Responses are made on a 5-point scale from 0='strongly disagree' to 4='strongly agree' to items such as 'I'm always optimistic about my future', with six of the items summed to achieve an overall optimism score. Psychometric

Table 1 Summary of descriptions and discussion points for open-label placebo (OLP) and conventional placebo (CP)

Discussion point	OLP	CP
What is this treatment?	Placebo capsules containing no active ingredient.	A new pharmacological agent, (drug codename).
What does previous research say?	Placebo effects have been found to reduce insomnia symptoms, but deception is typically involved. Some recent studies in other countries have shown OLP effects outside of sleep.	Some recent studies in other countries have shown that (drug codename) can reduce insomnia symptoms.
What are the mechanisms of action?	Placebo effects trigger the brain to release neurotransmitters that can improve symptoms. These responses can be automatic.	(Drug codename) triggers the brain to release neurotransmitters that can improve sleep.
How should I take the capsules?	Work best if taken exactly as prescribed. A positive attitude helps, but is not essential.	
How long will it take to work?	Generally work quickly, but can take longer for some people.	

properties indicate adequate construct validity and modest internal consistency correlations ranging from 0.43 to 0.63.⁵³

*Big-Five Inventory (BFI)—openness to experience.*⁵⁴ The BFI is a widely used taxonomy of personality traits. Ten self-report items assessing the domain openness to experience were selected for this trial. The BFI has good construct validity and convergent validity with other similar personality measures.⁵⁴

Insomnia treatment history. A purpose-designed measure was developed to assess participants' self-reported history of treatments for insomnia (pharmacological, psychological, complementary) and their perceived efficacy of these treatments.

Procedure

Figure 1 shows the study flow. Eligible participants will be invited to attend their first on-site visit (visit 1). At visit 1, all participants will be given an actigraphy watch to wear and CSD to complete, for the 2-week baseline period. Participants will return to the study site for visit 2 (day 14) and complete outcome measures. At visit 2, they will be randomised to one of three conditions: OLP, CP or OC. In the case of the placebo arms, the researcher will discuss the relevant treatment with each participant according to five points, summarised in **table 1**, with the OLP information guided by previous OLP trials.^{19,20} In the OLP arm there will be an additional emphasis on explaining that

most placebo research in the past has involved deception, while those in the CP arm will be provided with information about the fake medication.

Participants who accept an invite to OLP or CP will be provided with placebo capsules and the dosage instructions, which require them to take two placebo capsules 10–15 min prior to going to bed for the 2-week treatment period. Participants will be asked to record their daily treatment adherence in the CSD. Participants who decline an invite to the OLP or CP arms will continue in the study, unless they choose to withdraw. During the treatment period, all participants will continue completing the CSD and wearing the actigraphy watch. At the final study visit (visit 3), all participants will return the CSD and actigraphy watches, and participants in the OLP and CP arms will return the capsule bottles and any unused capsules as an additional measure of treatment adherence. All participants will complete post-treatment outcome measures and be debriefed at the end of their study participation. On-site study visits may be replaced with video-link visits in the event that COVID-19 social distancing requirements prevent face-to-face interactions, with study materials being couriered if necessary.

Sample size

There have been no previous studies on OLP for insomnia. Charlesworth *et al*'s²⁸ meta-analysis of OLP for other conditions (eg, chronic pain, irritable bowel syndrome) found a large effect size of $d=0.88$ relative to no treatment. Assuming a similar effect size, to obtain 80% power with $\alpha=0.05$, we would require 22 participants to detect this effect size comparing OLP and OC arms. However, we are also seeking to determine whether OLPs differ in efficacy relative to CPs—which has not been investigated systematically. We hypothesise that OLP will be less effective than CP and that the effect size for this comparison will be weaker than the effect size for OLP versus OC. To detect an effect size for OLP versus CP of $d=0.5$, we will require 64 participants per type of placebo treatment to achieve 80% power with $\alpha=0.05$. Therefore, using an allocation ratio of 2:2:1, we would require 64, 64, 32 (total N=160) participants for OLP, CP and OC, respectively, to obtain sufficient power for both of the critical comparisons. However, because the cmRCT involves two-stage consent process, we will recruit N=267 participants into the initial cohort aiming to randomise 107 to each placebo arm and 53 to OC, which assumes at least two-thirds (67%) uptake in the placebo arms, including allowance for 10% attrition. This will provide us with sufficient power for both intent-to-treat (ITT) (primary) and per-protocol (sensitivity) analyses.

Randomisation and blinding

Randomisation tables will be generated using randomizer.org. Randomisation will be conducted on a 2:2:1 ratio (OLP, CP, OC) and stratified according to gender and scores on the ISI (<15 and ≥ 15). Randomisation will take place after the eligibility screening and baseline

assessment (allocation concealment) at visit 2. Blinding of the participant and researcher administering the treatment is not possible, however, data analysis will be performed by a blinded member of the team.

Statistical analysis

Primary outcome

ISI. ITT will be used as the primary analysis to compare the effect of OLP, CP and OC on insomnia symptoms. The primary endpoint (mean scores on the ISI post-treatment) will be assessed using a multilevel model with group (OLP, CP, OC) and baseline (visit 2) ISI score included as factors. Consistent with previous analysis methods in cmRCTs, the ITT population for the OLP and CP arms will consist of all participants who receive an offer of treatment, regardless of treatment uptake. As a secondary sensitivity analysis, a per-protocol approach will also be implemented including only those participants in the OLP, CP and OC arms who complete the study. The analyses will include participants who scored ≥ 10 on the ISI at screening, but we will also conduct sensitivity analysis excluding any participants who fall below this threshold during the baseline period (assessed at visit 2).

Secondary outcomes

Uptake. A X^2 test of independence will be used to determine whether rates of accepting treatment differ when OLP versus CP is offered.

Response rate. Group differences in the proportion of participants achieving a clinically significant response (ie, ≥ 6 -point reduction and/or < 10 on the ISI) will be analysed using a X^2 test of independence.

Other sleep parameters and outcomes. Other sleep measures (self-report and objective), daytime fatigue, depression, anxiety, stress, treatment satisfaction, expectancy and side effects will be assessed as per the primary ISI outcome.

Predictors of uptake and the placebo effect

Potential predictors of uptake and the placebo effect will be assessed using a combination of logistic and linear regressions to identify which clinical, demographic and personality characteristics predict uptake (logistic) of and the placebo effect (linear: ISI scores and related outcomes; logistic: response rates) to OLP and CP.

For all analyses, results will be considered statistically significant when $p < 0.05$.

Patient and public involvement

Neither patients nor members of the public had any involvement in the design of the OPIN trial.

ETHICS AND DISSEMINATION

The study is registered with the Australian and New Zealand Clinical Trial Registry (see online supplemental material 1). The study protocol (version 6 dated 10 September 2020), participant information sheets and consent forms (see online supplemental material 2) and

relevant materials, and the ethical aspects of this trial have been reviewed and approved by The University of Sydney Human Research Ethics Committee (HREC 2019/552). Study data will be collected and stored using the university's Research Electronic Data Capture system, with password-protected access provided to relevant research personnel only. All data will be securely stored for a minimum of 15 years. The PI will be responsible for communicating important protocol modifications. The final dataset will be maintained by the PI, with de-identified participant data available on request following publication to researchers providing a methodologically and ethically sound proposal, in addition to the full study protocol, statistical analysis plan and analytical code. Results from this trial will be disseminated in the form of peer-reviewed conference proceedings and publications.

Contributors BC conceptualised the study and is the principal investigator and grant holder. BC, AS, LS, NG, DSJC, DB and ZA made significant contributions to designing the study. BC, AS, LS, NG, DB and ZA contributed to developing the screening procedures. BC and DSJC were responsible for the power calculations and statistical analysis plan. BC, AS and ZA were responsible for creating the first draft of this manuscript. BC, AS, LS, NG, DSJC, DB and ZA provided input and feedback, and approved the final draft of this manuscript.

SPIRIT Item2b: WHO Trial Registration Data Set

Data Category	Information
Primary registry and trial identifying number	Australian New Zealand Clinical Trial Registry https://www.anzctr.org.au Trial ID: ACTRN12620001080910
Date of registration in primary registry	20 October 2020
Secondary identifying numbers	2019/552
Source(s) of monetary or material support	School of Psychology, The University of Sydney
Primary sponsor	The University of Sydney
Secondary sponsor(s)	N/A
Contact for public queries	A/Prof Ben Colagiuri PhD, +61 2 9351 4589, ben.colagiuri@sydney.edu.au
Contact for scientific queries	A/Prof Ben Colagiuri PhD, +61 2 9351 4589, ben.colagiuri@sydney.edu.au
Public Title	Open-label placebo for insomnia (OPIN)
Scientific Title	Open-label placebo for insomnia (OPIN): a cohort multiple randomised controlled trial in adults with moderate or severe insomnia
Countries of recruitment	Australia

Health condition(s) or problem(s) studied	Insomnia
Intervention(s)	Active comparator: open-label placebo (OLP) capsules Placebo comparator: conventional (deceptive) placebo (CP) capsules
Key inclusion and exclusion criteria	Inclusion criteria: adult (≥ 18 years), self-reported insomnia symptoms with score on Insomnia Severity Index (ISI) ≥ 10 Exclusion criteria: sleep disorder other than insomnia, severe medical or psychiatric comorbidity, current regular ($\geq 1/\text{week}$) administration of sleep medication, current psychological treatment for sleep, currently pregnant, planning to conceive within 3 months, breastfeeding or 1-year post-partum, regular night shift work
Study type	Cohort multiple randomised controlled trial Allocation: randomised Intervention model: parallel assignment Masking: Open-label placebo arm (both participant and investigator are aware of treatment allocation, conventional placebo arm (participant is blind but investigator aware of treatment allocation) Primary purpose: Intervention outcome
Date of first enrolment	
Target sample size	267
Recruitment status	Not yet recruiting

Primary outcome(s)	Determine whether OLP is associated with reductions in self-reported insomnia symptoms measured with the Insomnia Severity Index (ISI), compared to CP and no treatment.
Key secondary outcomes	Improvements in objective and subjective sleep parameters, daytime fatigue, anxiety, depression and stress, expectancy, treatment satisfaction and self-reported side effects; clinically significant improvements in insomnia in OLP, relative to CP and no treatment; rate of uptake of OLP relative to CP; predictors of uptake and placebo effect

Insomnia Symptoms Study**PARTICIPANT INFORMATION STATEMENT****(1) What is this study about?**

You are invited to take part in a research study examining the sleeping patterns of people who experience insomnia symptoms. We are interested to understand how insomnia symptoms (such as difficulty falling asleep, or frequent awakenings) change over time. We hope to use the data collected in this study to inform how people might respond to different treatments for insomnia.

You have been invited to participate in this study because you have expressed interest in taking part and identify as having insomnia symptoms. This Participant Information Statement tells you about the research. Knowing what is involved will help you decide if you want to take part.

Please read this sheet carefully and get in touch with the researchers to ask questions about anything that you don't understand or want to know more about. Contact details can be found at the end of this information sheet. Participation in this research study is voluntary.

By giving your consent to take part in this study you are telling us that you:

- ✓ Understand what you have read.

- Agree to take part in the research study as outlined below.
- Agree to the use of your personal information as described

(2) Who is running the study?

The study is being carried out by the following researchers:

- Ben Colagiuri, Associate Professor, The University of Sydney School of Psychology
- Louise Sharpe, Professor, The University of Sydney School of Psychology
- Nick Glozier, Professor of Psychological Medicine, Central Clinical School of Medicine and Brain & Mind Centre, University of Sydney
- Delwyn Bartlett, Associate Professor, Central Clinical School of Medicine, University of Sydney
- Amelia Scott, PhD, The University of Sydney School of Psychology
- Daniel Costa, Honorary Research Fellow, Pain Management Research Institute, University of Sydney
- Zahava Ambarchi, Study Coordinator, The University of Sydney, School of Psychology

This study is being funded by The University of Sydney and the Australian Research Council.

(3) What will the study involve for me?

The study will take place over four weeks. You will firstly be required to complete an online questionnaire to determine whether you are eligible to take part. If you are eligible, you will be contacted to schedule a time to attend the study site.

The screening questionnaire asks about basic details such as your age and gender, your current insomnia symptoms and treatment, and some brief questions about your mental and physical health. Participating in the study involves wearing a watch-like sleep monitoring device, as well as completing a daily sleep diary and questions about your mental and physical health.

If you agree to participate, you will be asked to attend three visits:

- 1) On visit one, you will collect the watch and a sleep diary
- 2) On the second visit, you will complete some brief questionnaires about sleep and other symptoms over the previous two weeks
- 3) On the final visit you will return the watch and complete some brief questionnaires about sleep and other symptoms over the previous two weeks

Prior to your attendance to any of the three face-to-face study visits, the study coordinator will contact you and ask you some questions regarding cold and flu-like symptoms and contact with positive or potential cases of COVID-19. If necessary, your visit will be rescheduled or conducted via phone, in which case the watch and sleep diary will be mailed to you.

The sleep monitoring device is called an Actiwatch. It is a safe, non-invasive and accurate way to measure people's sleep-wake patterns. You will be asked to wear it continuously (day and night). You will also be asked to complete a brief sleep diary each morning that should take you approximately 2 minutes. An SMS text reminder will be sent to you each morning to remind you to complete the sleep diary.

At visit two and the final visit, you will be required to complete a longer survey. This survey includes questions about your insomnia symptoms, fatigue, mood, other physical symptoms experienced. These questionnaires will take approximately 25 minutes.

You may be asked to take part in Phase 2 of the study. This invitation will be randomly determined so that some people are invited into Phase 2 while others are not. It will be entirely your decision as to whether you choose to participate in Phase 2 and you will be provided with an additional information sheet and consent form regarding this at your second site visit.

(4) How much of my time will the study take?

This screening questionnaire should take you approximately 20 minutes. We estimate that attending the study site on three occasions and completing testing will take 1 hour and 15 minutes in total (i.e., <30min each visit, see the above diagram), excluding travel time. Completing the sleep diary each morning will take approximately 2 minutes per day. Therefore, the total time commitment is approximately 2 ½ hours.

(5) Who can take part in the study?

People eligible to take part will be adults (age over 18), proficient in English, who experience insomnia symptoms of at least moderate severity. People cannot take part if they are currently receiving treatment (such as psychological therapy, prescription or over-the-counter medications, herbal supplements or homeopathic formulations), undertake regular night shift work, are currently pregnant, intending to fall pregnant in the next 3 months, breastfeeding or less than 1 year post-partum, if they seem to have a different kind of sleep disorder (e.g. sleep apnoea), if they are currently experiencing a significant medical condition requiring invasive treatment or surgery, and/or psychiatric condition.

(6) Do I have to be in the study? Can I withdraw from the study once I've started?

Being in this study is completely voluntary and you do not have to take part. Your decision whether to participate will not affect your current or future relationship with the researchers or anyone else at the University of Sydney. If you decide to take part in the study and then change your mind later, you are free to withdraw at any time. You can do this by informing the study coordinator (by phone or by e-mail) that you no longer wish to take part. If you decide to withdraw from the study, we will not collect any more information from you. Please let us know at the time when you withdraw what you would like us to do with the information we have collected about you up to that point. If you wish your information will be removed from our study records and will not be included in the study results, up to the point that we have analysed and published the results.

(7) Are there any risks or costs associated with being in the study?

Aside from giving up your time, we do not expect that there will be any risks or costs associated with taking part in this study.

(8) Are there any benefits associated with being in the study?

You will receive \$60 after you complete the study. This will be provided to you in the form of cash. In terms of other benefits associated with participation, we anticipate that our results will provide benefit to our understanding of insomnia symptoms and their treatment.

(9) What will happen to information about me that is collected during the study?

During the study, we will be collecting various types of information from you. This includes your responses on survey questions, your daily sleep diary, and data that is collected from actigraphy watches.

In order to send you SMS reminders to complete your sleep diary, your phone number (but not your name or other personal details) will be provided to a third-party SMS service provider to perform this service. The SMS provider will only be used to send you reminder texts to complete the sleep diary for the duration of your involvement in the study, and only for that purpose. No other text messages will be sent to you during or after your participation in the study.

Data collected from this study will be published in journal articles and/or conference presentations in summary form without any personally identifying information. In addition, de-identified data may be shared with other researchers or research groups for the purpose of conducting extra analyses of our data, or comparing our results against similar studies. Under no circumstances will we provide identifying information (e.g. names, contact details) to other researchers.

By providing your consent, you are agreeing to us collecting personal information about you for the purposes of this research study. Your information will only be used for the purposes outlined in this Participant Information Statement, unless you consent otherwise. Your information will be stored securely and your identity/information will be kept strictly confidential, except as required by law. Study finding may be published, but you will not be individually identified in these publications.

(10) Can I tell other people about the study?

Yes, you are welcome to tell other people about the study. However, if you know other people participating in the study, it is best to talk with them about the study after you have all completed your sessions, in case your experiences influence theirs.

(11) What if I would like further information about the study?

When you have read this information, please get in touch with the researchers if you have any further questions. You can contact either the study coordinator on [REDACTED] or at psychology.sleepstudy@sydney.edu.au, or Ben Colagiuri at ben.colagiuri@sydney.edu.au or (02) 9351 4589.

(12) Will I be told the results of the study?

You have a right to receive feedback about the overall results of this study. You can tell us that you wish to receive feedback by ticking the relevant box below. This feedback will be in the form of a one page summary of the study findings. You will receive this feedback after the study is finished.

As well as the overall results of the study, you will be provided with specific feedback about your sleep-wake patterns based on reporting in a sleep diary as well as wearing the Actiwatch. This will be provided shortly after your participation in the study has been completed.

(13) What if I have a complaint or any concerns about the study?

Research involving humans in Australia is reviewed by an independent group of people called a Human Research Ethics Committee (HREC). The ethical aspects of this study have been approved by the HREC of the University of Sydney [2019/552]. As part of this process, we

have agreed to carry out the study according to the *National Statement on Ethical Conduct in Human Research (2007)*. This statement has been developed to protect people who agree to take part in research studies.

If you are concerned about the way this study is being conducted or you wish to make a complaint to someone independent from the study, please contact the university using the details outlined below. Please quote the study title and protocol number.

The Manager, Ethics Administration, University of Sydney:

OPIN Consent Form_1, Version 2 dated 10 September 2020

Insomnia Symptoms Study**CONSENT FORM**

If you have read the participant information sheet and would like to take part, you may complete the consent process below.

- 1) I have read the Participant Information Statement and have been able to discuss my involvement in the study with the researchers if I wished to do so.

 Yes No

- 2) I understand that participation involves three visits to the University of Sydney, Camperdown, Sydney, and that a researcher will contact me by phone and/or e-mail to arrange this.

 Yes No

- 3) I understand that my mobile number will be shared with a third-party SMS provider for the sole purpose of sending me a daily text reminder while I am part of the study.

 Yes No

- 4) First name

- 5) Surname

- 6) Contact phone: (Note, include area code if using a landline)

- 7) Please indicate any preferences regarding a suitable day or time to contact you:
- 8) Contact email (please note that we will automatically send you a copy of the participant information statement for you to keep).
- 9) I understand that being in this study is completely voluntary and I do not have to take part. My decision whether to be in the study will not affect my relationship with the researchers or anyone else at the University of Sydney now or in the future.
- Yes
 No
- 10) I understand that I can withdraw from the study at any time.
- Yes
 No
- 11) I would like to receive feedback about the overall results of the study.
- Yes
 No

Insomnia Symptoms Study

Optional additional participation - [REDACTED] for Insomnia Symptoms

PARTICIPANT INFORMATION STATEMENT

(1) What is this study about?

You are invited to take part phase 2 of the study you are currently participating in. The aim of this part is to determine whether [REDACTED] to improve your insomnia symptoms.

You have been invited to take part in this study by chance. In other words, your participant ID has been randomly selected via a computer programme.

This Participant Information Statement tells you about *the additional parts of this research*.

Participation in this part of the research study is voluntary.

By giving your consent to take part in this study you are telling us that you:

- ✓ Understand what you have read.
- ✓ Agree to take part in the research study as outlined below.
- ✓ Agree to the use of your personal information as described.

(2) What will this part of the study involve?

For the remaining two weeks of the study, your participation in the study will not change, with the exception of two parts;

- You will be required to take [REDACTED]
- You will be asked to record your [REDACTED] intake along with your sleep diary

(3) Will this take additional time?

We anticipate that the above additions to your research participation will take very little extra time.

(4) Do I have to be in this part of the study? Can I withdraw from the study once I've started?

At this point in the study, you have a few choices available to you:

- A. You may take part in the additional component of the study that involves [REDACTED]
- B. You may choose not to take part in the additional component of the study but continue in the way that you previously agreed to
- C. You may choose to withdraw altogether, which you can do at any time

You do not have to agree to take part in this component of the research study, and your decision whether to participate or not will not affect your current or future relationship with the researchers or anyone else at the University of Sydney.

If you decide to take part in the study and then change your mind later, you are free to withdraw at any time. You can do this by informing the researchers (by phone or by e-mail) that you no longer wish to take part. If you decide to withdraw from the study, we will not collect any more information from you. Please let us know at the time when you withdraw what you would like us to do with the information we have collected about you up to that point. If you wish your information will be removed from our study records and will not be included in the study results, up to the point that we have analysed and published the results.

(5) Are there any risks or costs associated with being in this part of the study?

There are no known risks of taking [REDACTED]

(6) Are there any benefits associated with being in the study?

It is possible that you will experience improvements to your insomnia symptoms after taking [REDACTED]. You will not receive additional reimbursement for this additional component of the study – i.e. you will still receive \$60 at the end of the study.

(7) What will happen to information about me that is collected during the study?

We will collect some additional information from you if you take part in this part of the study. This includes your thoughts and expectations about taking [REDACTED], and your compliance with [REDACTED]. Otherwise, there are no differences to the way that your information is collected and managed in this part of the study.

(8) Can I tell other people about the study?

You are welcome to speak to others about this study (e.g. a friend, family member, GP), but we ask that you do not speak to other people who may be participating in the study. This is because other people will not have been invited to this part of the study, and we do not wish for this knowledge to affect them in any way.

(9) What if I have a complaint or any concerns about the study?

Research involving humans in Australia is reviewed by an independent group of people called a Human Research Ethics Committee (HREC). The ethical aspects of this study have been approved by the HREC of the University of Sydney [2019/552]. As part of this process, we have agreed to carry out the study according to the *National Statement on Ethical Conduct in Human Research (2007)*. This statement has been developed to protect people who agree to take part in research studies.

If you are concerned about the way this study is being conducted or you wish to make a complaint to someone independent from the study, please contact the university using the details outlined below. Please quote the study title and protocol number.

The Manager, Ethics Administration, University of Sydney:

- **Telephone:** +61 2 8627 8176
- **Email:** ro.humanethics@sydney.edu.au
- **Fax:** +61 2 8627 8177 (Facsimile)

This information sheet is for you to keep

OPIN Consent Form_2, Version 2 dated 10 September 2020

Insomnia Symptoms Study

Optional Additional Consent

PARTICIPANT INFORMATION STATEMENT

I, [PRINT NAME], agree to take part in the additional component of this research study.

In giving my consent I state that:

- I understand the purpose of the study, what I will be asked to do, and any risks/benefits involved.
- I have read the Participant Information Statement and have been able to discuss my involvement in the study with the researchers if I wished to do so.
- The researchers have answered any questions that I had about the study and I am happy with the answers.
- I understand that being in this study is completely voluntary and I do not have to take part. My decision whether to be in the study will not affect my relationship with the researchers or anyone else at the University of Sydney now or in the future.
- I understand that I can withdraw from the study at any time.
- I understand that personal information about me that is collected over the course of this project will be stored securely and will only be used for purposes that I have agreed to. I understand that information about me will only be told to others with my permission, except as required by law.

- I give consent for the researchers to contact me about future opportunities to participate in research relating to the current study (e.g. to be interviewed about my experiences)

- I give consent for the researchers to contact me to see whether I am interested in taking part in any media stories related to the current study

I give consent for the researchers to contact me about future opportunities to participate in research not directly related to the current study

Please note: under no circumstance would we forward your information onto another party without your prior consent.
