BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (http://bmjopen.bmj.com).

If you have any questions on BMJ Open's open peer review process please email info.bmjopen@bmj.com

ABSTRACT

Introduction: Over 800,000 people die due to suicide each year and suicide presents huge psychological, economic and social burdens for individuals, communities and countries as a whole. Low and middle income countries (LMICs) are disproportionately affected by suicide. The strongest risk factor for suicide is a previous suicide attempt, and other types of self-harm have been found to be robust predictors of suicidal behaviour. An approach that brings together multiple sectors including education, labour, business, law, politics and the media is crucial to tackling suicide and self-harm. The World Health Organization highlights that evaluations of the knowledge and attitudes that priority groups, not only healthcare staff, have of mental health and suicidal behaviour are key to suicide prevention strategies. The aim of this systematic review is to examine the knowledge, attitudes and experiences different stakeholders in LMICs have of self-harm and suicide.

Methods and analysis: Medline, Embase, PsycInfo, CINAHL, BNI, Social Sciences and Cochrane library will be searched. Reviewers working independently of each other will screen search results, select studies for inclusion, extract and check extracted data, and rate the quality of the studies using the STROBE and CASP checklists. In anticipation of heterogeneity, a narrative synthesis of quantitative studies will be provided and meta-ethnography will be used to synthesise qualitative studies.

Ethics and dissemination*:* Ethical approval is not required. A report will be provided for the funding body, and the systematic review will be submitted for publication in a high-impact, peer-reviewed, open access journal. Results will also be disseminated at conferences, seminars, congresses and symposia and to relevant stakeholders.

PROSPERO registration number: CRD42019135323

Strengths and limitations of this study

- This systematic review protocol has been written according to the Preferred Reporting Items for Systematic review and Meta-Analysis (PRISMA-P) 2015 checklist.

For peer review only

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

- The review will conform to the PRISMA statement and to the Cochrane systematic review literature guidelines when results are reported
- A strength of this review is the mixed methods approach, which is particularly suited to the investigation of complex topics
- A limitation of the review is the inclusion of peer reviewed studies only, however language restrictions will not be applied
- The findings from this review will be form a robust basis for the development of a community survey on knowledge and attitudes towards self-harm and suicide in South Asia.

Keywords

Self-harm; suicide; attitudes; knowledge; experience; quantitative; qualitative; mixed methods, low and middle income countries, LMICs

INTRODUCTION

The World Health Organization (WHO) estimate that over 800,000 people die due to suicide each year; 1 person every 40 seconds [1]. Suicide disproportionately affects low and middle income countries (LMICs), in 2014 the WHO reported that 75.5% of suicides globally occur in LMICs, and in South East Asia suicide is the leading cause of death in 15-29 year olds [1]. However, the under-reporting and misclassification of suicide as a cause of death in LMICs mean that suicide rates are likely higher than reported [1, 2]. Every suicide death is a tragedy for families, friends and communities and suicide presents huge psychological, economic and social burdens for individuals, communities and countries as a whole [1].

The strongest risk factor for suicide is a previous suicide attempt, and the WHO suggest that for each adult that dies from suicide there may be 20 more suicide attempts [1]. Suicide attempts and suicide are types of self-harm that are distinct from non-suicidal self-injury (NSSI) in terms of intent, however NSSI has also been found to be a robust predictor of suicidal behaviour [3, 4, 5]. A review of

the literature on the links between NSSI and suicidal behaviour found that people who engaged in NSSI were significantly more likely to report suicidal ideation and to have attempted suicide than those who did not [3]. Furthermore, the link between NSSI and suicidal behaviour remained after controlling for age, gender, and ethnicity and NSSI was a stronger predictor of suicidal behaviour than depression, hopelessness, post-traumatic stress, borderline personality disorder, family functioning and child abuse [3].

Suicide and self-harm are the result of complex interactions between genetic, psychological, biological, cultural, sociodemographic and social factors [1, 6, 7]. Although the healthcare sector clearly has a vital role to play in tackling suicide and self-harm, an approach that brings together multiple sectors including education, labour, business, law, politics and the media is crucial [1, 8].

The knowledge, attitudes and experiences stakeholders from various sectors have of suicide and self-harm are likely to influence suicide and self-harm prevention and intervention strategies. A recent review by the WHO [8] highlights that evaluations of the knowledge and attitudes that priority groups, for example policy makers and community groups, not only healthcare staff, have of mental health and suicidal behaviour are key to the collection of high quality surveillance data and prevention strategies. Reviews to date have focused on the knowledge, attitudes and experiences that healthcare professionals have towards self-harm and suicide [9, 10, 11, 12]. The aim of this systematic review is to examine various stakeholders' knowledge, attitudes and experiences of self-harm and suicide. This systematic review is being undertaken as part of the South Asia Self Harm Initiative (SASHI) project, which aims to help to find effective responses to self-harm and suicide in South Asia by building capability and capacity in research infrastructure and expertise in the region. Findings from this systematic review will be used to inform the development of a survey on knowledge, attitudes and well-being in South Asia. Thus, we are particularly interested in studies conducted in South Asia and countries with comparable healthcare systems or cultural backgrounds.

Research question

The SPICE (**S**etting, **P**erspective, phenomena of **I**nterest, **C**omparison, **E**valuation) framework was used to generate the research question that will be addressed by this systematic review [13]:

- What are stakeholders' knowledge, attitudes and experiences of self-harm and suicide in LMICs?

METHODS AND ANALYSIS

This protocol conforms to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Protocols (PRISMA-P) checklist (see Supplementary File 1) [14]. We will conform to the PRISMA statement and to the Cochrane systematic review literature guidelines when reporting the results [15, 16]. This systematic review has been registered on PROSPERO [17].

Search strategy

A Betsi Cadwaladr University Health Board (BCUHB) librarian with expertise in systematic reviews has assisted the authors in the development of the search strategy (see Appendix 1). We will search Medline, Embase, PsycInfo, CINAHL, BNI, Social Sciences and Cochrane library. We will not apply any language restrictions to the search criteria. EndNote and Microsoft Word will be used to manage initial search results, screening and data throughout the review. We will update the searches prior to publication to ensure the latest papers are included. Reference lists from included studies and any identified systematic or literature reviews will also be searched by hand. Study authors will be contacted in instances when it has not been possible to retrieve full text articles and when clarification regarding inclusion criteria e.g. participant age, is required.

Study selection criteria

Inclusion criteria are empirical studies conducted in LMICs, as defined by the Organisation for Economic Co-operation and Development [18], irrespective of the study design, whose focus is on the knowledge, attitudes or experiences of stakeholders towards self-harm and/or suicide, where participants are aged 16 years and above. Stakeholders are people who have experienced self-harm

and/or have attempted suicide themselves, relatives, friends, co-workers, and healthcare workers of those who have self-harmed, attempted or committed suicide and people in the social, healthcare, government, and criminal justice sectors. Exclusion criteria are studies conducted in high income countries (HICs) and studies whose participants are not aged 16 years and above. Studies whose main focus is on the prevalence and/or predictors of self-harm and/or suicide, relationships between state and/or trait characteristics and self-harm and/or suicide, euthanasia, terrorism, or epidemiology will also be excluded. Systematic and literature reviews will be consulted for relevant references but will not be included in the review. Opinion pieces, editorials, book reviews, and conference and poster abstracts will not be included in the review.

The selection of studies for inclusion will adhere to the Cochrane guidelines and the process of selection of eligible studies will be illustrated via a PRISMA diagram [16]. Following deduplication of search results in EndNote, the following screening process will be undertaken in order to select studies for inclusion in the systematic review:

1) Titles and abstracts will be read by two reviewers independently, and relevance and fit with the inclusion criteria will be assessed. Those of no obvious relevance will be excluded and any disagreements will be resolved with a third reviewer (and the wider expert group if necessary).

2) Full text articles of remaining studies will be retrieved and read by two reviewers independently to assess their suitability for inclusion in the final review, disagreements will be resolved by discussion with a third reviewer (and the wider expert group if necessary). Both reviewers will populate a piloted pro-forma for each full text paper read (see Appendix 2).

Data extraction

Data will be extracted from selected studies by one reviewer, and a second reviewer will check for accuracy. Extracted data will be recorded on a piloted pro-forma (see Appendix 2), and will reflect the inclusion criteria and the designated aims of the review, derived from the article as a whole. Discrepancies will be resolved through discussion (with the wider expert group if necessary). Additional data will be requested from study authors when necessary. Data extraction of qualitative studies (and for qualitative components in studies with mixed methods) will adhere to the same methods and will be reviewed independently.

For peer review only

Outcomes

Outcomes of interest include:

- The identification of relevant information on stakeholders' knowledge, attitudes and experiences of self-harm and suicide, particularly in South Asia and in countries with comparable healthcare systems and cultural backgrounds
- The quantitative methods and measures that have been used to investigate stakeholders' attitudes towards and knowledge about self-harm and suicide and their psychometric properties
- The qualitative methods that have been used to investigate stakeholders' attitudes towards, knowledge about, and experiences of self-harm and suicide.

The identified outcomes will inform the development of a survey on knowledge, attitudes and well-being in South Asia as part of the SASHI project.

Quality assessment

All eligible studies will be subject to quality appraisal. The quality of included quantitative studies will be appraised using the STROBE checklist [19]. The STROBE Statement consists of a checklist of 22 items, which relate to the title, abstract, introduction, methods, results and discussion sections of articles. Eighteen items are common to cohort studies, case-control studies and cross-sectional studies and four are specific to each of the three study designs. The quality of included qualitative studies will

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

be appraised using the CASP checklist [20]. The 10-item CASP tool was considered to be the most suitable tool to consider the quality parameters of qualitative work, and is a well-validated and accepted tool [15]. Both the STROBE and CASP checklists will be applied independently by two reviewers and any disagreements will be resolved with a third reviewer (and the wider expert group if necessary).

Studies will not be excluded on the basis of poor quality alone, rather we will discuss the implications of including studies rated as being of poor quality and place them within context of the wider literature. This low threshold for inclusion will be applied so that the review can benefit from researcher insight and theoretical as well as empirical contributions. The relative quality of included studies will be critically considered during the analysis and in reference to the developed synthesis and we will attempt to assess the trustworthiness of the evidence in terms of transparency in reporting, consensus and expertise of the team and relevant stakeholders, and draw on common sense and expertise as well as evidence.

Descriptive analysis and data synthesis

We anticipate that the quantitative studies included in the review will be heterogenous and this will prevent meta-analysis. We will provide a narrative synthesis of quantitative studies, structured around population characteristics and the geographical region of studies. We will provide summaries of the quantitative methods and measures used to investigate stakeholders' attitudes towards and knowledge about self-harm and suicide and their psychometric properties.

Meta-ethnography will be used to synthesise qualitative studies [21]. Initially reciprocal translation will be performed by comparing the concepts presented in different studies. A chronological approach will be taken to reciprocal translation; studies will be arranged chronologically, concepts from papers one and two will be compared, and the synthesis of papers one and two will then be compared with paper three, and so forth, as is described elsewhere [22]. When contradictions between studies are identified, we will perform refutational synthesis by exploring and explaining these. A 'lines-of-

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

argument' synthesis, that links and explains concepts presented by different studies, will be conducted so that an interpretation of all included studies can be presented.

Two reviewers will lead data synthesis. Emergent analysis, and any discrepancies, will be discussed with other members of the review team. Microsoft Office software will be used to facilitate data synthesis.

Patient and public involvement

No patients or members of the public were involved in the design of this study.

Amendments

An amendment has been made to the initial registration of this systematic review in PROSPERO, which details that only studies from LMICs will be included in this review, and studies from HICs will be excluded from this review. Any further amendments to this protocol will be documented in the full review.

ETHICS AND DISSEMINATION

Ethics approval is not required as this is a protocol for the systematic review of previously published data. In addition to a report to the funding body, we intend to submit the systematic review for publication in a high-impact, peer-reviewed journal. We will select an open access journal to ensure free access to undergraduate and graduate students, researchers, academics and research groups. Results will also be disseminated at conferences seminars, congresses and symposia and to relevant stakeholders.

Acknowledgements: The authors would like to thank Mrs Nia Morris (NM) from BCUHB library for her contribution to the development of the search strategy.

Supplementary file 1: PRISMA-P (Preferred Reporting Items for Systematic review and Meta-Analysis Protocols) 2015 checklist: recommended items to address in a systematic review protocol*

Section and topic	Item No	Checklist item	Complete
ADMINISTRATIVE INFORMATION			
Title:			
Identification	1a	Identify the report as a protocol of a systematic review	X
Update	1b	If the protocol is for an update of a previous systematic review, identify as such	N/A
Registration	2	If registered, provide the name of the registry (such as PROSPERO) and registration number	X
Authors:			
Contact	3a	Provide name, institutional affiliation, e-mail address of all protocol authors; provide physical mailing address of corresponding author	X
Contributions	3b	Describe contributions of protocol authors and identify the guarantor of the review	X
Amendments	4	If the protocol represents an amendment of a previously completed or published protocol, identify as such and list changes; otherwise, state plan for documenting important protocol amendments	X
Support:			
Sources	5a	Indicate sources of financial or other support for the review	X
Sponsor	5b	Provide name for the review funder and/or sponsor	X
Role of sponsor or funder	5c	Describe roles of funder(s), sponsor(s), and/or institution(s), if any, in developing the protocol	X
INTRODUCTION			
Rationale	6	Describe the rationale for the review in the context of what is already known	X
Objectives	7	Provide an explicit statement of the question(s) the review will address with reference to participants, interventions, comparators, and outcomes (PICO)	X
METHODS			
Eligibility criteria	8	Specify the study characteristics (such as PICO, study design, setting, time frame) and report characteristics (such as years considered, language, publication	X

For peer review only

6/bmjopen-2020-046545 on 2 June 2021. Downloaded from http://bmjopen.bmj.com/ on April 18, 2024 by guest. Protected by copyright.

		status) to be used as criteria for eligibility for the review	
Information sources	9	Describe all intended information sources (such as electronic databases, contact with study authors, trial registers or other grey literature sources) with planned dates of coverage	X
Search strategy	10	Present draft of search strategy to be used for at least one electronic database, including planned limits, such that it could be repeated	X
Study records:			
Data management	11a	Describe the mechanism(s) that will be used to manage records and data throughout the review	X
Selection process	11b	State the process that will be used for selecting studies (such as two independent reviewers) through each phase of the review (that is, screening, eligibility and inclusion in meta-analysis)	X
Data collection process	11c	Describe planned method of extracting data from reports (such as piloting forms, done independently, in duplicate), any processes for obtaining and confirming data from investigator	X
Data items	12	List and define all variables for which data will be sought (such as PICO items, funding sources), any pre-planned data assumptions and simplifications	X
Outcomes and prioritization	13	List and define all outcomes for which data will be sought, including prioritization of main and additional outcomes, with rationale	X
Risk of bias in individual studies	14	Describe anticipated methods for assessing risk of bias of individual studies, including whether this will be done at the outcome or study level, or both; state how this information will be used in data synthesis	X
Data synthesis	15a	Describe criteria under which study data will be quantitatively synthesised	X
	15b	If data are appropriate for quantitative synthesis, describe planned summary measures, methods of handling data and methods of combining data from studies, including any planned exploration of consistency (such as I^2, Kendall's τ)	N/A
	15c	Describe any proposed additional analyses (such as sensitivity or subgroup analyses, meta-regression)	X
	15d	If quantitative synthesis is not appropriate, describe the type of summary planned	X
Meta-bias(es)	16	Specify any planned assessment of meta-bias(es) (such as publication bias across studies, selective reporting within studies)	N/A
Confidence in cumulative evidence	17	Describe how the strength of the body of evidence will be assessed (such as GRADE)	N/A

ABSTRACT

Introduction: Over 800,000 people die due to suicide each year and suicide presents huge psychological, economic and social burdens for individuals, communities and countries as a whole. Low and middle income countries (LMICs) are disproportionately affected by suicide. The strongest risk factor for suicide is a previous suicide attempt, and other types of self-harm have been found to be robust predictors of suicidal behaviour. An approach that brings together multiple sectors including education, labour, business, law, politics and the media is crucial to tackling suicide and self-harm. The World Health Organization highlights that evaluations of the knowledge and attitudes that priority groups, not only healthcare staff, have of mental health and suicidal behaviour are key to suicide prevention strategies. The aim of this systematic review is to examine the knowledge, attitudes and experiences different stakeholders in LMICs have of self-harm and suicide.

Methods and analysis: Medline, Embase, PsycInfo, CINAHL, BNI, Social Sciences and Cochrane library will be searched. Reviewers working independently of each other will screen search results, select studies for inclusion, extract and check extracted data, and rate the quality of the studies using the STROBE and CASP checklists. In anticipation of heterogeneity, a narrative synthesis of quantitative studies will be provided and meta-ethnography will be used to synthesise qualitative studies.

Ethics and dissemination: Ethical approval is not required. A report will be provided for the funding body, and the systematic review will be submitted for publication in a high-impact, peer-reviewed, open access journal. Results will also be disseminated at conferences, seminars, congresses and symposia and to relevant stakeholders.

PROSPERO registration number: CRD42019135323

Strengths and limitations of this study

For peer review only

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

- A strength of this systematic review protocol is that it has been written according to the Preferred Reporting Items for Systematic review and Meta-Analysis (PRISMA-P) 2015 checklist.
- A strength of the review is that it will conform to the PRISMA statement and to the Cochrane systematic review literature guidelines when results are reported
- A strength of this review is that both quantitative and qualitative evidence will be assessed.
- A limitation of the review is the inclusion of peer reviewed studies only, however language restrictions will not be applied
- We anticipate that the quantitative studies included in the review will be heterogenous, therefore a limitation will be the lack of meta-analysis

Keywords

Self-harm; suicide; attitudes; knowledge; experience; quantitative; qualitative; low and middle income countries, LMICs

INTRODUCTION

The World Health Organization (WHO) estimate that over 800,000 people die due to suicide each year; 1 person every 40 seconds [1]. Suicide disproportionately affects low and middle income countries (LMICs), in 2014 the WHO reported that 75.5% of suicides globally occur in LMICs, and in South East Asia suicide is the leading cause of death in 15-29 year olds [1]. However, the under-reporting and misclassification of suicide as a cause of death in LMICs mean that suicide rates are likely higher than reported [1, 2]. Every suicide death is a tragedy for families, friends and communities and suicide presents huge psychological, economic and social burdens for individuals, communities and countries as a whole [1]. Reducing suicide is a key indicator for the United Nations sustainable development goal to ensure healthy lives and promote well-being at all ages globally [3]. However, much of the published literature on suicide relates to high income countries (HICs), and to effect change a better understanding of suicide within the cultural, political and socio-economic

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

context of LMICs is needed. Patient profiles, suicide rates, aetiology and methods differ between LMICs and HICs [4]. For example, research to date indicates that the ratio of women to men who die by suicide in LMICs is much lower than in HICs [5]. Furthermore, where marriage is considered to be a protective factor for women in HICs, it is less so for women in some LMICs, and self-immolation and the consumption of pesticides are far more common methods in LMICs than in HICs [6-9].

The strongest risk factor for suicide is a previous suicide attempt, and the WHO suggest that for each adult who dies from suicide there may be 20 others attempting suicide [1]. Suicide attempts and suicide are types of self-harm that are often differentiated from non-suicidal self-injury (NSSI) in terms of intent, frequency, methods, lethality and cognitions [10]. While the intent of suicidal behaviours is to kill oneself, the intent of NSSI is not. NSSI behaviours are more frequent than suicide and suicide attempts, with individuals employing more varying and less lethal methods and it is suggested that the cognitions related to NSSI concern temporary relief while those related to suicidal behaviour concern permanent relief [10-13]. Similarly to the literature on suicide, much of that concerning self-harm is focussed on HICs [14-16], where self-harm has been found to be a robust predictor of suicidal behaviour, with this link remaining after controlling for age, gender, and ethnicity [12, 17-18. A systematic review of the limited empirical research on self-harm in LMICs found that the prevalence of NSSI and suicide attempts in LMICs was comparable to HICs and that the most common methods of NSSI in LMICs were hitting, cutting, wound picking and biting and these findings were similar to evidence from HICs [16] Risk factors identified for self-harm in LMICs were often family related, for example family conflict, divorced parents and childhood abuse, and protective factors were high family functioning and understanding parents, which were attributed to greater reliance on family in LMICs compared to many Western HICs [16].

Suicide and self-harm in both LMICs and HICs are the result of complex interactions between genetic, psychological, biological, cultural, sociodemographic and social factors [1, 19-20]. Although the healthcare sector clearly has a vital role to play in tackling suicide and self-harm in LMICs, an approach that brings together multiple sectors including education, labour, business, law, politics and

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

the media is crucial [1, 21]. The knowledge, attitudes and experiences stakeholders from various sectors have of suicide and self-harm are likely to influence suicide and self-harm prevention and intervention strategies. A recent review by the WHO [21] highlights that evaluations of the knowledge and attitudes that priority groups, for example policy makers and community groups, not only healthcare staff, have of mental health and suicidal behaviour are key to the collection of high quality surveillance data and prevention strategies. Reviews to date have focused on the knowledge, attitudes and experiences that healthcare professionals have towards self-harm and suicide [22-25]. The aim of this systematic review is to examine various stakeholders' knowledge, attitudes and experiences of self-harm and suicide. Therefore, in addition to stakeholders from the healthcare sector, other stakeholders who will be included in this review are people who have experienced self-harm and/or have attempted suicide themselves, and their relatives, friends, and co-workers, and stakeholders from the social, healthcare, government, and criminal justice sectors. We are interested in exploring the range of publications on the broad spectrum of knowledge, attitudes and experiences that these various stakeholders may have concerning suicide and self-harm, including for example, knowledge stakeholders may have on prevalence and risk and protective factors for suicide and self-harm, stigmatising or empathetic attitudes towards those who self-harm, and experiences such as providing or receiving medical treatment for self-harm. This systematic review is being undertaken as part of the South Asia Self Harm Initiative (SASHI) project, which aims to help to find effective responses to self-harm and suicide in South Asia by building capability and capacity in research infrastructure and expertise in the region. Findings from this systematic review will be used to inform the development of a survey on knowledge, attitudes and well-being in South Asia. Thus, we are particularly interested in studies conducted in South Asia and countries with comparable healthcare systems or cultural backgrounds.

Research question

The SPICE (**S**etting, **P**erspective, phenomena of **I**nterest, **C**omparison, **E**valuation) framework was used to generate the research question that will be addressed by this systematic review [26]:

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

- What are stakeholders' knowledge, attitudes and experiences of self-harm and suicide in LMICs?

METHODS AND ANALYSIS

This protocol conforms to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Protocols (PRISMA-P) checklist (see Supplementary File 1) [27]. We will conform to the PRISMA statement and to the Cochrane systematic review literature guidelines when reporting the results [28-29]. This systematic review has been registered on PROSPERO [30].

Search strategy

A Betsi Cadwaladr University Health Board (BCUHB) librarian with expertise in systematic reviews has assisted the authors in the development of the search strategy (see Appendix 1). We will search Medline, Embase, PsycInfo, CINAHL, BNI, Social Sciences and Cochrane library. We will not apply any language restrictions to the search criteria. EndNote and Microsoft Word will be used to manage initial search results, screening and data throughout the review. We will update the searches prior to publication to ensure the latest papers are included. Reference lists from included studies and any identified systematic or literature reviews will also be searched by hand. Study authors will be contacted in instances when it has not been possible to retrieve full text articles and when clarification regarding inclusion criteria e.g. participant age, is required.

Study selection criteria

Inclusion criteria are empirical studies conducted in LMICs, as defined by the Organisation for Economic Co-operation and Development [31], irrespective of the study design, whose focus is on the knowledge, attitudes or experiences of stakeholders towards self-harm and/or suicide, where participants are aged 16 years and above. Studies that include stakeholders' knowledge, attitudes and experiences of suicide and self-harm related to those under 16 will be included. Stakeholders are people who have experienced self-harm and/or have attempted suicide themselves, relatives, friends,

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

co-workers, and healthcare workers of those who have self-harmed, attempted or completed suicide and people in the social, healthcare, government, and criminal justice sectors. Exclusion criteria are studies conducted in high income countries (HICs) and studies whose participants are not aged 16 years and above. Studies whose main focus is on the prevalence and/or predictors of self-harm and/or suicide, relationships between state and/or trait characteristics and self-harm and/or suicide, euthanasia, terrorism, or epidemiology will also be excluded. Systematic and literature reviews will be consulted for relevant references but will not be included in the review. Opinion pieces, editorials, book reviews, and conference and poster abstracts will not be included in the review.

The selection of studies for inclusion will adhere to the Cochrane guidelines and the process of selection of eligible studies will be illustrated via a PRISMA diagram [29]. Following deduplication of search results in EndNote, the following screening process will be undertaken in order to select studies for inclusion in the systematic review:

1) Titles and abstracts will be read by two reviewers independently, and relevance and fit with the inclusion criteria will be assessed. Those of no obvious relevance will be excluded and any disagreements will be resolved with a third reviewer (and the wider expert group if necessary).

2) Full text articles of remaining studies will be retrieved and read by two reviewers independently to assess their suitability for inclusion in the final review, disagreements will be resolved by discussion with a third reviewer (and the wider expert group if necessary). Both reviewers will populate a piloted pro-forma for each full text paper read (see Appendix 2).

Data extraction

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

Data will be extracted from selected studies by one reviewer, and a second reviewer will check for accuracy. Extracted data will be recorded on a piloted pro-forma (see Appendix 2), and will reflect the inclusion criteria and the designated aims of the review, derived from the article as a whole. Discrepancies will be resolved through discussion (with the wider expert group if necessary). Additional data will be requested from study authors when necessary. Data extraction of qualitative studies (and for qualitative components in studies with mixed methods) will adhere to the same methods and will be reviewed independently.

For peer review only

Outcomes

Outcomes of interest include:

- The identification of relevant information on stakeholders' knowledge, attitudes and experiences of self-harm and suicide, particularly in South Asia and in countries with comparable healthcare systems and cultural backgrounds
- The quantitative methods and measures that have been used to investigate stakeholders' attitudes towards and knowledge about self-harm and suicide and their psychometric properties
- The qualitative methods that have been used to investigate stakeholders' attitudes towards, knowledge about, and experiences of self-harm and suicide.

The identified outcomes will inform the development of a survey on knowledge, attitudes and well-being in South Asia as part of the SASHI project.

Quality assessment

All eligible studies will be subject to quality appraisal. The quality of included quantitative studies will be appraised using the STROBE checklist [32]. The STROBE Statement consists of a checklist of 22 items, which relate to the title, abstract, introduction, methods, results and discussion sections of articles. Eighteen items are common to cohort studies, case-control studies and cross-sectional studies and four are specific to each of the three study designs. The quality of included qualitative studies will

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

be appraised using the CASP checklist [33]. The 10-item CASP tool was considered to be the most suitable tool to consider the quality parameters of qualitative work, and is a well-validated and accepted tool [28]. Both the STROBE and CASP checklists will be applied independently by two reviewers and any disagreements will be resolved with a third reviewer (and the wider expert group if necessary).

Studies will not be excluded on the basis of poor quality alone, rather all studies that meet the inclusion criteria will be included in the review. This low threshold for inclusion will be applied so that the review can benefit from researcher insight and theoretical as well as empirical contributions. The relative quality of included studies will be critically considered and discussed in the review.

Descriptive analysis and data synthesis

We anticipate that the quantitative studies included in the review will be heterogenous and this will prevent meta-analysis. We will provide a narrative synthesis of quantitative studies, structured around population characteristics and the geographical region of studies. We will provide summaries of the quantitative methods and measures used to investigate stakeholders' attitudes towards and knowledge about self-harm and suicide and their psychometric properties.

Meta-ethnography will be used to synthesise qualitative studies [34]. Initially reciprocal translation will be performed by comparing the concepts presented in different studies. A chronological approach will be taken to reciprocal translation; studies will be arranged chronologically, concepts from papers one and two will be compared, and the synthesis of papers one and two will then be compared with paper three, and so forth, as is described elsewhere [35]. When contradictions between studies are identified, we will perform refutational synthesis by exploring and explaining these. A 'lines-of-argument' synthesis, that links and explains concepts presented by different studies, will be conducted so that an interpretation of all included studies can be presented.

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

Two reviewers will lead data synthesis. Emergent analysis, and any discrepancies, will be discussed with other members of the review team. Microsoft Office software will be used to facilitate data synthesis.

Patient and public involvement

No patients or members of the public were involved in the design of this study.

Amendments

An amendment has been made to the initial registration of this systematic review in PROSPERO, which details that only studies from LMICs will be included in this review, and studies from HICs will be excluded from this review. Any further amendments to this protocol will be documented in the full review.

For peer review only

ETHICS AND DISSEMINATION

Ethics approval is not required as this is a protocol for the systematic review of previously published data. In addition to a report to the funding body, we intend to submit the systematic review for publication in a high-impact, peer-reviewed journal. We will select an open access journal to ensure free access to undergraduate and graduate students, researchers, academics and research groups. Results will also be disseminated at conferences seminars, congresses and symposia and to relevant stakeholders.

Acknowledgements: The authors would like to thank Mrs Nia Morris (NM) from BCUHB library for her contribution to the development of the search strategy.

Contributions: CR, RM, PH, AK, MK conceived the research idea. SN led the development of the search strategy, with input from NM, RM, AK, PH. RM, SN, MK, AK, PH, CR conceived the manuscript. RM lead the drafting of the manuscript with contributions from SN, AE, SB, MK, AK, PH, NC, CR. All authors approved the final manuscript.

Supplementary file 1: PRISMA-P (Preferred Reporting Items for Systematic review and Meta-Analysis Protocols) 2015 checklist: recommended items to address in a systematic review protocol*

Section and topic	Item No	Checklist item	Complete
ADMINISTRATIVE INFORMATION			
Title:			
Identification	1a	Identify the report as a protocol of a systematic review	X
Update	1b	If the protocol is for an update of a previous systematic review, identify as such	N/A
Registration	2	If registered, provide the name of the registry (such as PROSPERO) and registration number	X
Authors:			
Contact	3a	Provide name, institutional affiliation, e-mail address of all protocol authors; provide physical mailing address of corresponding author	X
Contributions	3b	Describe contributions of protocol authors and identify the guarantor of the review	X
Amendments	4	If the protocol represents an amendment of a previously completed or published protocol, identify as such and list changes; otherwise, state plan for documenting important protocol amendments	X
Support:			
Sources	5a	Indicate sources of financial or other support for the review	X
Sponsor	5b	Provide name for the review funder and/or sponsor	X
Role of sponsor or funder	5c	Describe roles of funder(s), sponsor(s), and/or institution(s), if any, in developing the protocol	X
INTRODUCTION			
Rationale	6	Describe the rationale for the review in the context of what is already known	X
Objectives	7	Provide an explicit statement of the question(s) the review will address with reference to participants, interventions, comparators, and outcomes (PICO)	X
METHODS			
Eligibility criteria	8	Specify the study characteristics (such as PICO, study design, setting, time frame) and report characteristics (such as years considered, language, publication	X

		status) to be used as criteria for eligibility for the review	
Information sources	9	Describe all intended information sources (such as electronic databases, contact with study authors, trial registers or other grey literature sources) with planned dates of coverage	X
Search strategy	10	Present draft of search strategy to be used for at least one electronic database, including planned limits, such that it could be repeated	X
Study records:			
Data management	11a	Describe the mechanism(s) that will be used to manage records and data throughout the review	X
Selection process	11b	State the process that will be used for selecting studies (such as two independent reviewers) through each phase of the review (that is, screening, eligibility and inclusion in meta-analysis)	X
Data collection process	11c	Describe planned method of extracting data from reports (such as piloting forms, done independently, in duplicate), any processes for obtaining and confirming data from investigator	X
Data items	12	List and define all variables for which data will be sought (such as PICO items, funding sources), any pre-planned data assumptions and simplifications	X
Outcomes and prioritization	13	List and define all outcomes for which data will be sought, including prioritization of main and additional outcomes, with rationale	X
Risk of bias in individual studies	14	Describe anticipated methods for assessing risk of bias of individual studies, including whether this will be done at the outcome or study level, or both; state how this information will be used in data synthesis	X
Data synthesis	15a	Describe criteria under which study data will be quantitatively synthesised	X
	15b	If data are appropriate for quantitative synthesis, describe planned summary measures, methods of handling data and methods of combining data from studies, including any planned exploration of consistency (such as I^2, Kendall's τ)	N/A
	15c	Describe any proposed additional analyses (such as sensitivity or subgroup analyses, meta-regression)	X
	15d	If quantitative synthesis is not appropriate, describe the type of summary planned	X
Meta-bias(es)	16	Specify any planned assessment of meta-bias(es) (such as publication bias across studies, selective reporting within studies)	N/A
Confidence in cumulative evidence	17	Describe how the strength of the body of evidence will be assessed (such as GRADE)	N/A

ABSTRACT

Introduction: Over 800,000 people die due to suicide each year and suicide presents huge psychological, economic and social burdens for individuals, communities and countries as a whole. Low and middle income countries (LMICs) are disproportionately affected by suicide. The strongest risk factor for suicide is a previous suicide attempt, and other types of self-harm have been found to be robust predictors of suicidal behaviour. An approach that brings together multiple sectors including education, labour, business, law, politics and the media is crucial to tackling suicide and self-harm. The World Health Organization highlights that evaluations of the knowledge and attitudes that priority groups, not only healthcare staff, have of mental health and suicidal behaviour are key to suicide prevention strategies. The aim of this systematic review is to examine the knowledge, attitudes and experiences different stakeholders in LMICs have of self-harm and suicide.

Methods and analysis: Medline, Embase, PsycInfo, CINAHL, BNI, Social Sciences and Cochrane library will be searched. Reviewers working independently of each other will screen search results, select studies for inclusion, extract and check extracted data, and rate the quality of the studies using the STROBE and CASP checklists. In anticipation of heterogeneity, a narrative synthesis of quantitative studies will be provided and meta-ethnography will be used to synthesise qualitative studies.

Ethics and dissemination*:* Ethical approval is not required. A report will be provided for the funding body, and the systematic review will be submitted for publication in a high-impact, peer-reviewed, open access journal. Results will also be disseminated at conferences, seminars, congresses and symposia and to relevant stakeholders.

PROSPERO registration number: CRD42019135323

Strengths and limitations of this study

For peer review only

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

- A strength of this systematic review protocol is that it has been written according to the Preferred Reporting Items for Systematic review and Meta-Analysis (PRISMA-P) 2015 checklist.
- A strength of the review is that it will conform to the PRISMA statement and to the Cochrane systematic review literature guidelines when results are reported
- A strength of this review is that both quantitative and qualitative evidence will be assessed.
- A limitation of the review is the inclusion of peer reviewed studies only, however language restrictions will not be applied
- As it is likely that the quantitative studies included in the review will be heterogenous, therefore a limitation will be the lack of meta-analysis

Keywords

Self-harm; suicide; attitudes; knowledge; experience; quantitative; qualitative; low and middle income countries, LMICs

INTRODUCTION

The World Health Organization (WHO) estimate that over 800,000 people die due to suicide each year; 1 person every 40 seconds [1]. Suicide disproportionately affects low and middle income countries (LMICs), in 2014 the WHO reported that 75.5% of suicides globally occur in LMICs, and in South East Asia suicide is the leading cause of death in 15-29 year olds [1]. However, the under-reporting and misclassification of suicide as a cause of death in LMICs mean that suicide rates are likely higher than reported [1, 2]. Every suicide death is a tragedy for families, friends and communities and suicide presents huge psychological, economic and social burdens for individuals, communities and countries as a whole [1]. Reducing suicide is a key indicator for the United Nations sustainable development goal to ensure healthy lives and promote well-being at all ages globally [3]. However, much of the published literature on suicide relates to high income countries (HICs), and to effect change a better understanding of suicide within the cultural, political and socio-economic

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

context of LMICs is needed. Patient profiles, suicide rates, aetiology and methods differ between LMICs and HICs [4]. For example, research to date indicates that the ratio of women to men who die by suicide in LMICs is much lower than in HICs [5]. Furthermore, while marriage is considered to be a protective factor for women in HICs, it is less so for women in some LMICs, and self-immolation and the consumption of pesticides are far more common methods in LMICs than in HICs [6-9].

The strongest risk factor for suicide is a previous suicide attempt, and the WHO suggest that for each adult who dies from suicide there may be 20 others attempting suicide [1]. Harm arising from suicidal behaviour, suicide attempts and suicide are types of self-harm that are often differentiated from non-suicidal self-injury (NSSI) in terms of intent, frequency, methods, lethality and cognitions [10]. The motivation for suicidal behaviours is often to remove suffering ande the intent of suicidal behaviours is to end one's life, whereas the intent of NSSI is not. NSSI behaviours are more frequent than suicide and suicide attempts, with individuals employing more varying and less lethal methods, and it is suggested that the cognitions related to NSSI concern temporary relief while those related to suicidal behaviour concern permanent relief [10-13]. Similarly to the literature on suicide, much of that concerning NSSI is focussed on HICs [14-16], where NSSI has been found to be a robust predictor of suicidal behaviour, with this link remaining after controlling for age, gender, and ethnicity [12, 17-18]. A systematic review of the limited empirical research on self-harm, including suicidal self-harm and NSSI, in LMICs found that the prevalence of NSSI and suicide attempts in LMICs was comparable to HICs, that the most common methods of NSSI in LMICs were hitting, cutting, wound picking and biting and these findings were similar to evidence from HICs [16] Risk factors identified for suicidal self-harm and NSSI in LMICs were often family related, for example family conflict, divorced parents and childhood abuse, and protective factors were high family functioning and understanding parents, which were attributed to greater reliance on family in LMICs compared to many Western HICs [16].

Suicide and self-harm in both LMICs and HICs are the result of complex interactions between genetic, psychological, biological, cultural, sociodemographic and social factors [1, 19-20]. Although

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

the healthcare sector clearly has a vital role to play in tackling suicide and self-harm in LMICs, an approach that brings together multiple sectors including education, labour, business, law, politics and the media is crucial [1, 21]. The knowledge, attitudes and experiences stakeholders from various sectors have of suicide and self-harm are likely to influence suicide and self-harm prevention and intervention strategies. A recent review by the WHO [21] highlights that evaluations of the knowledge and attitudes that priority groups, for example policy makers and community groups, not only healthcare staff, have of mental health and suicidal behaviour are key to the collection of high quality surveillance data and prevention strategies. Reviews to date have focused on the knowledge, attitudes and experiences that healthcare professionals have towards self-harm and suicide [22-25]. The aim of this systematic review is to examine various stakeholders' knowledge, attitudes and experiences of self-harm and suicide. Therefore, in addition to stakeholders from the healthcare sector, other stakeholders who will be included in this review are people who have experienced self-harm and/or have attempted suicide themselves, and their relatives, friends, and co-workers, and stakeholders from the social, healthcare, government, and criminal justice sectors. We are interested in exploring the range of publications on the broad spectrum of knowledge, attitudes and experiences that these various stakeholders may have concerning suicide and self-harm, including for example, knowledge stakeholders may have on prevalence and risk and protective factors for suicide and self-harm, stigmatising or empathetic attitudes towards those who self-harm, and experiences such as providing or receiving medical treatment for self-harm. This systematic review is being undertaken as part of the South Asia Self Harm Initiative (SASHI) project, which aims to help to find effective responses to self-harm and suicide in South Asia by building capability and capacity in research infrastructure and expertise in the region. Findings from this systematic review will be used to inform the development of a survey on knowledge, attitudes and well-being in South Asia. Thus, we are particularly interested in studies conducted in South Asia and countries with comparable healthcare systems or cultural backgrounds.

Research question

For peer review only

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

The SPICE (**S**etting, **P**erspective, phenomena of **I**nterest, **C**omparison, **E**valuation) framework was used to generate the research question that will be addressed by this systematic review [26]:

- What are stakeholders' knowledge, attitudes and experiences of self-harm and suicide in LMICs?

METHODS AND ANALYSIS

This protocol conforms to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Protocols (PRISMA-P) checklist (see Supplementary File 1) [27]. We will conform to the PRISMA statement and to the Cochrane systematic review literature guidelines when reporting the results [28-29]. This systematic review has been registered on PROSPERO [30].

Search strategy

A Betsi Cadwaladr University Health Board (BCUHB) librarian with expertise in systematic reviews has assisted the authors in the development of the search strategy (see Appendix 1). We will search Medline, Embase, PsycInfo, CINAHL, BNI, Social Sciences and Cochrane library. We will not apply any language restrictions to the search criteria. EndNote and Microsoft Word will be used to manage initial search results, screening and data throughout the review. We will update the searches prior to publication to ensure the latest papers are included. Reference lists from included studies and any identified systematic or literature reviews will also be searched by hand. Study authors will be contacted in instances when it has not been possible to retrieve full text articles and when clarification regarding inclusion criteria e.g. participant age, is required.

Study selection criteria

Inclusion criteria are empirical studies conducted in LMICs, as defined by the Organisation for Economic Co-operation and Development [31], irrespective of the study design, whose focus is on the knowledge, attitudes or experiences of stakeholders towards self-harm and/or suicide, where participants are aged 16 years and above. Studies that include stakeholders' knowledge, attitudes and

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

experiences of suicide and self-harm related to those under 16 will be included. Stakeholders are people who have experienced self-harm and/or have attempted suicide themselves, relatives, friends, co-workers, and healthcare workers of those who have self-harmed, attempted or completed suicide and people in the social, healthcare, government, and criminal justice sectors. Exclusion criteria are studies conducted in high income countries (HICs) and studies whose participants are not aged 16 years and above. Studies whose main focus is on the prevalence and/or predictors of self-harm and/or suicide, relationships between state and/or trait characteristics and self-harm and/or suicide, euthanasia, terrorism, or epidemiology will also be excluded. Systematic and literature reviews will be consulted for relevant references but will not be included in the review. Opinion pieces, editorials, book reviews, and conference and poster abstracts will not be included in the review.

The selection of studies for inclusion will adhere to the Cochrane guidelines and the process of selection of eligible studies will be illustrated via a PRISMA diagram [29]. Following deduplication of search results in EndNote, the following screening process will be undertaken in order to select studies for inclusion in the systematic review:

1) Titles and abstracts will be read by two reviewers independently, and relevance and fit with the inclusion criteria will be assessed. Those of no obvious relevance will be excluded and any disagreements will be resolved with a third reviewer (and the wider expert group if necessary).

2) Full text articles of remaining studies will be retrieved and read by two reviewers independently to assess their suitability for inclusion in the final review, disagreements will be resolved by discussion with a third reviewer (and the wider expert group if necessary). Both reviewers will populate a piloted pro-forma for each full text paper read (see Appendix 2).

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

1
2
3 1 **Data extraction**
4
5 2 Data will be extracted from selected studies by one reviewer, and a second reviewer will check for
6
7 3 accuracy. Extracted data will be recorded on a piloted pro-forma (see Appendix 2), and will reflect the
8
9 4 inclusion criteria and the designated aims of the review, derived from the article as a whole.
10
11 5 Discrepancies will be resolved through discussion (with the wider expert group if necessary).
12
13 6 Additional data will be requested from study authors when necessary. Data extraction of qualitative
14
15 7 studies (and for qualitative components in studies with mixed methods) will adhere to the same
16
17 8 methods and will be reviewed independently.
18
19 9
20
21 10 **Outcomes**
22
23 11 Outcomes of interest include:
24
25
26 12 • The identification of relevant information on stakeholders' knowledge, attitudes and
27
28 13 experiences of self-harm and suicide, particularly in South Asia and in countries with
29
30 14 comparable healthcare systems and cultural backgrounds
31
32 15 • The quantitative methods and measures that have been used to investigate stakeholders'
33
34 16 attitudes towards and knowledge about self-harm and suicide and their psychometric
35
36 17 properties
37
38 18 • The qualitative methods that have been used to investigate stakeholders' attitudes towards,
39
40 19 knowledge about, and experiences of self-harm and suicide.
41
42
43 20 The identified outcomes will inform the development of a survey on knowledge, attitudes and well-
44
45 21 being in South Asia as part of the SASHI project.
46
47 22
48
49 23 **Quality assessment**
50
51 24 All eligible studies will be subject to quality appraisal. The quality of included quantitative studies
52
53 25 will be appraised using the STROBE checklist [32]. The STROBE Statement consists of a checklist of
54
55 26 22 items, which relate to the title, abstract, introduction, methods, results and discussion sections of
56
57 27 articles. Eighteen items are common to cohort studies, case-control studies and cross-sectional studies
58
59
60

For peer review only

and four are specific to each of the three study designs. The quality of included qualitative studies will be appraised using the CASP checklist [33]. The 10-item CASP tool was considered to be the most suitable tool to consider the quality parameters of qualitative work, and is a well-validated and accepted tool [28]. Both the STROBE and CASP checklists will be applied independently by two reviewers and any disagreements will be resolved with a third reviewer (and the wider expert group if necessary).

Studies will not be excluded on the basis of poor quality alone, rather all studies that meet the inclusion criteria will be included in the review. This low threshold for inclusion will be applied so that the review can benefit from researcher insight and theoretical as well as empirical contributions. The relative quality of included studies will be critically considered and discussed in the review.

Descriptive analysis and data synthesis

We anticipate that the quantitative studies included in the review will be heterogenous and this will prevent meta-analysis. We will provide a narrative synthesis of quantitative studies, structured around population characteristics and the geographical region of studies. We will provide summaries of the quantitative methods and measures used to investigate stakeholders' attitudes towards and knowledge about self-harm and suicide and their psychometric properties.

Meta-ethnography will be used to synthesise qualitative studies [34]. Initially reciprocal translation will be performed by comparing the concepts presented in different studies. A chronological approach will be taken to reciprocal translation; studies will be arranged chronologically, concepts from papers one and two will be compared, and the synthesis of papers one and two will then be compared with paper three, and so forth, as is described elsewhere [35]. When contradictions between studies are identified, we will perform refutational synthesis by exploring and explaining these. A 'lines-of-argument' synthesis, that links and explains concepts presented by different studies, will be conducted so that an interpretation of all included studies can be presented.

For peer review only - http://bmjopen.bmj.com/site/about/guidelines.xhtml

Two reviewers will lead data synthesis. Emergent analysis, and any discrepancies, will be discussed with other members of the review team. Microsoft Office software will be used to facilitate data synthesis.

Patient and public involvement

No patients or members of the public were involved in the design of this study.

Amendments

An amendment has been made to the initial registration of this systematic review in PROSPERO, which originally stated that studies from both HICs and LMICs would be included in the review. The PROSPERO record was amended to state that only studies from LMICs will be included in this review, and studies from HICs will be excluded from this review. Any further amendments to this protocol will be documented in the full review.

ETHICS AND DISSEMINATION

Ethics approval is not required as this is a protocol for the systematic review of previously published data. In addition to a report to the funding body, we intend to submit the systematic review for publication in a high-impact, peer-reviewed journal. We will select an open access journal to ensure free access to undergraduate and graduate students, researchers, academics and research groups. Results will also be disseminated at conferences seminars, congresses and symposia and to relevant stakeholders.

Supplementary file 1: PRISMA-P (Preferred Reporting Items for Systematic review and Meta-Analysis Protocols) 2015 checklist: recommended items to address in a systematic review protocol*

Section and topic	Item No	Checklist item	Complete
ADMINISTRATIVE INFORMATION			
Title:			
Identification	1a	Identify the report as a protocol of a systematic review	X
Update	1b	If the protocol is for an update of a previous systematic review, identify as such	N/A
Registration	2	If registered, provide the name of the registry (such as PROSPERO) and registration number	X
Authors:			
Contact	3a	Provide name, institutional affiliation, e-mail address of all protocol authors; provide physical mailing address of corresponding author	X
Contributions	3b	Describe contributions of protocol authors and identify the guarantor of the review	X
Amendments	4	If the protocol represents an amendment of a previously completed or published protocol, identify as such and list changes; otherwise, state plan for documenting important protocol amendments	X
Support:			
Sources	5a	Indicate sources of financial or other support for the review	X
Sponsor	5b	Provide name for the review funder and/or sponsor	X
Role of sponsor or funder	5c	Describe roles of funder(s), sponsor(s), and/or institution(s), if any, in developing the protocol	X
INTRODUCTION			
Rationale	6	Describe the rationale for the review in the context of what is already known	X
Objectives	7	Provide an explicit statement of the question(s) the review will address with reference to participants, interventions, comparators, and outcomes (PICO)	X
METHODS			
Eligibility criteria	8	Specify the study characteristics (such as PICO, study design, setting, time frame) and report characteristics (such as years considered, language, publication	X

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46

		status) to be used as criteria for eligibility for the review	
Information sources	9	Describe all intended information sources (such as electronic databases, contact with study authors, trial registers or other grey literature sources) with planned dates of coverage	X
Search strategy	10	Present draft of search strategy to be used for at least one electronic database, including planned limits, such that it could be repeated	X
Study records:			
Data management	11a	Describe the mechanism(s) that will be used to manage records and data throughout the review	X
Selection process	11b	State the process that will be used for selecting studies (such as two independent reviewers) through each phase of the review (that is, screening, eligibility and inclusion in meta-analysis)	X
Data collection process	11c	Describe planned method of extracting data from reports (such as piloting forms, done independently, in duplicate), any processes for obtaining and confirming data from investigator	X
Data items	12	List and define all variables for which data will be sought (such as PICO items, funding sources), any pre-planned data assumptions and simplifications	X
Outcomes and prioritization	13	List and define all outcomes for which data will be sought, including prioritization of main and additional outcomes, with rationale	X
Risk of bias in individual studies	14	Describe anticipated methods for assessing risk of bias of individual studies, including whether this will be done at the outcome or study level, or both; state how this information will be used in data synthesis	X
Data synthesis	15a	Describe criteria under which study data will be quantitatively synthesised	X
	15b	If data are appropriate for quantitative synthesis, describe planned summary measures, methods of handling data and methods of combining data from studies, including any planned exploration of consistency (such as I^2, Kendall's τ)	N/A
	15c	Describe any proposed additional analyses (such as sensitivity or subgroup analyses, meta-regression)	X
	15d	If quantitative synthesis is not appropriate, describe the type of summary planned	X
Meta-bias(es)	16	Specify any planned assessment of meta-bias(es) (such as publication bias across studies, selective reporting within studies)	N/A
Confidence in cumulative evidence	17	Describe how the strength of the body of evidence will be assessed (such as GRADE)	N/A

Appendix 2: Knowledge, attitudes, and experiences of self-harm and suicide in low and middle income countries systematic review: data extraction form

Notes for reviewers

Record any missing information as unclear or not described to ensure it is clear that the information was not found in the paper, not that you forgot to extract it

General information		
Date form completed		
Reviewer extracting data		
Study title		
Study authors		
Journal		
Year of publication		
Study author contact details		
Notes		
Study eligibility for inclusion in review		
Main focus on stakeholders' knowledge, attitudes and experiences of self-harm and/or suicide (excluding euthanasia or terrorism)	*Yes/No*	*Location in text (pg. #)*
Study population aged 16 and above (or can data from those aged 16 and above only can be extracted?)	*Yes/No*	*Location in text (pg. #)*
Low-middle income country	*Yes/No*	*Location in text (pg. #)*
Include or exclude	*Include/Exclude*	
Reason for exclusion	*Reasons for exclusion* *1) Knowledge, attitudes and experience of self-harm/suicide not main concern of study (including terrorism and euthanasia) include main phenomenon being studied in notes – to be reviewed after 25 studies* *1a) Completely irrelevant topic e.g. paper on depression, no mention of self-harm/suicide 1b) Focus on prevalence of suicide/self-harm* *1c) Focus on risk factors of suicide/self-harm* *1d) Focus on intervention only* *1e) Mention of self-harm/suicide however topic not relevant to attitudes, knowledge and experiences of self-harm/suicide* *2) Research not conducted in LMICs* *3) Research population not 16 and over* *4) Literature review* *5) Commentary, book review, editorial*	
Notes		
Characteristics of included studies: Participants		

For peer review only

	Description as stated in paper	*Location in text (pg. #)*
Study location (Country and state/city/area) e.g. India, Bangalore		
Study setting e.g. hospital, community		
Study population e.g. nurses, community members		
Informed consent obtained	*Yes, No, Unclear*	
Total number of participants		
Exclusions and withdrawals		
Participant demographics e.g. Age Sex Race/Ethnicity Religious beliefs Mental illness diagnosis Physical illness diagnosis Other demographics		
Notes		
Characteristics of included studies: Methods		
	Description as stated in paper	*Location in text (pg. #)*
Aim of study/Research question(s) (implicit or explicit in text?)		
Study methodology (or methodologies)		
Quantitative measures used e.g. Acceptability of Suicide Scale and information on whether measure is validated (if applicable)		
Quantitative analysis methods and procedure		
Qualitative methods used e.g. focus group, one-to-one interviews, vignettes (if applicable)		
Theoretical/epistemological perspectives underpinning qualitative research (explicit or reviewer's interpretation)		
Qualitative data analysis methods and procedure		
Start date and end date		
Notes		
Characteristics of included studies: Results		
	Description as stated in paper	*Location in text (pg. #)*
Qualitative results – direct quotes from participants (first order)		

For peer review only

Qualitative results – study author's interpretations of data (second order)		
Quantitative results		
Indicators of acceptability to users (if applicable)		
Suggested mechanisms of intervention action (if applicable)		
Characteristics of included studies: Other information		
	Description as stated in paper	*Location in text (pg. #)*
Key conclusions of authors		
References to other relevant studies		
Correspondence required by reviewers for further information (who, when, what requested)		
Notes		

For peer review only
