(EMS) have reported significant improvements in their systems and patient outcomes.\(^2\) The European Resuscitation Council Guidelines 2021 recommend the implementation.\(^3\)

**Method** The RAD was launched in January 2020. It involves six EMS regions (Berlin, Dortmund, Kiel, Płön, Vorpommern-Greifswald, Rostock) and runs for 30 months following a structured process with continuous monitoring and ongoing sequential meetings. A key focus is on implementation of local projects. The goal is the systemic and continuous improvement measured by the German Resuscitation Registry (GRR) and the ‘RAD-Online-Tool’. The ‘RAD-Online-Tool’ is a system-self-assessment tool (SSAT) used at different points over the study period.

**Results** The six EMS regions have conducted the SSAT to identify potentials for improvement and translate them into multiple projects and goals. All participants are aiming for better data quality or improved usage of the GRR and to introduce a High-Performance-CPR-Program. Some EMS dispatch centers started to measure and improve their Telephone-CPR and/or Rapid Dispatch. Several systems will implement lay rescuer integration via app or improve AED integration. Other projects are on multiprofessional training for paramedics and emergency physicians or a Paramedic-Supervisor-Pilot program.

**Conclusion** Initial data and reports from participating EMS regions show success and potential for further improvement. For Germany, the format of consecutive workshops and continuous support seems particularly appropriate.

**236 DEVELOPING A YOUNG PERSONS ADVISORY GROUP (YPAG) TO INFORM THE DESIGN OF A STUDY TO IMPROVE PRE-HOSPITAL PAIN MANAGEMENT FOR CHILDREN AND YOUNG PEOPLE (CYP)**

1. JLT Breedveld*, 1CW van Vliet, 1E Boer, 1AAU Heutinck, 2GV van Geffen, 2XRJ Moors, 2C Slaig. 1Regional Ambulance Service Brabant, Midden-West-Noord, Den Bosch, The Netherlands; 2Radboud Universal Medical Center, Nijmegen, The Netherlands; 3Erasmus Universal Medical Center, Rotterdam, The Netherlands.

**Background** Patient and public involvement is an integral component of clinical research. A YPAG is group of young people with active involvement in the design and conduct of clinical research aimed at CYP.\(^1\) 2 Active collaboration with a YPAG can be mutually beneficial and can have a positive impact on study design and conduct.\(^2\) 3 We report on the involvement of young people, their influence on study design and the perceived benefits to members.

**Method** A UK secondary school was approached and ten 16–17 year old students agreed to form a YPAG. Three 1-hour sessions were planned involving arts-based activities to explore key challenges, predetermined iteratively by the administration of IV-analgesics by EMS paramedics. The us-guided fascia iliaca compartment block is another suitable option applied by NP-EMS in prehospital emergency care. Therefore we examined whether NP-EMS are able to successfully perform an US-guided FIC block in order to provide analgesia.

**Method** NP-EMS were educated in the execution of an US-guided FIC block. Hereafter the NP-EMS were dispatched to patients suspect for a proximal femur fracture. After confirmation of the diagnosis, the block was performed under sterile conditions using a SonoSite iViz Us-machine equipped with a 13–6 Mhz linear transducer (Secma) and a 80 mm block-needle (Stimuplex ultra 360, 22G). Under direct visual guidance the needle was inserted and 0,3 ml/kg lidocaine (10mg/ml) with adrenaline 5 ug/ml was injected. The quality of visualization of the needle in relation to the nerve, pain relief using Numeric Rating Scale (NRS) and occurrence of complications were evaluated.

**Results** In 99 patients an us-guided FIC-block was performed. One NRS score was lost, so 98 data pairs (before and after FIC Block) were available for analysis. Data were not normally distributed (D’Agostino & Pearson omnibus normality test P < 0.001). The block was effective in 96 patients, median NRS-pain score before FIC block was 8 interquartile range [7–9]. NRS decreased to median 3 interquartile range [1–6] after the FIC block, P < 0.0001 using Wilcoxon matched-pairs signed rank test Figure 1. No complications were noted. In two patients a correct visualization of the needle or spread of local anesthetic was not obtained.

**Conclusion** Well-trained NP-EMS can successfully and effectively perform an us-guided FIC block for providing adequate pain relief in patients with a suspected proximal femur fracture in the pre hospital setting.

**NURSE PRACTITIONERS EMS (NP-EMS) PERFORMED ULTRASOUND (US)-GUIDED FASCIA ILIACA COMPARTMENT BLOCK (FIC-BLOCK) IN PATIENTS WITH A SUSPECTED PROXIMAL FEMUR FRACTURE. PRELIMINARY DATA**

1JLT Breedveld*, 1CW van Vliet, 1E Boer, 1AAU Heutinck, 2GV van Geffen, 2XRJ Moors, 2C Slaig. 1Regional Ambulance Service Brabant, Midden-West-Noord, Den Bosch, The Netherlands; 2Radboud Universal Medical Center, Nijmegen, The Netherlands; 3Erasmus Universal Medical Center, Rotterdam, The Netherlands.

**Background** Prehospital pain treatment options for patients with a suspected proximal femur fracture consist mainly in the administration of IV-analgesics by EMS paramedics. The us-guided fascia iliaca compartment block is another suitable option applied by NP-EMS in prehospital emergency care. Therefore we examined whether NP-EMS are able to successfully perform an US-guided FIC block in order to provide analgesia.

**Method** NP-EMS were educated in the execution of an US-guided FIC block. Hereafter the NP-EMS were dispatched to patients suspect for a proximal femur fracture. After confirmation of the diagnosis, the block was performed under sterile conditions using a SonoSite iViz Us-machine equipped with a 13–6 Mhz linear transducer (Secma) and a 80 mm block-needle (Stimuplex ultra 360, 22G). Under direct visual guidance the needle was inserted and 0,3 ml/kg lidocaine (10mg/ml) with adrenaline 5 ug/ml was injected. The quality of visualization of the needle in relation to the nerve, pain relief using Numeric Rating Scale (NRS) and occurrence of complications were evaluated.

**Results** In 99 patients an us-guided FIC-block was performed. One NRS score was lost, so 98 data pairs (before and after FIC Block) were available for analysis. research team. Activities involved group work to explore and propose solutions for effective CYP recruitment and data collection, produce a study logo and review the plain English summary.

**Results** YPAG members produced insightful arts-based posters containing important ideas and concepts that were incorpo-
ated into the study design. A study logo was created, diaries and electronic communication methods to collect data were added and a variety of age-based leaflets were added to the recruitment strategy. Members reported several benefits from the sessions, including enhanced creative and problem-solving skills and members enjoyed the teamwork and collaborative approach.

**Conclusion** YPAG involvement resulted in meaningful improve-
ments to research design and members gained new knowledge, transferrable skills and improved confidence. This experience should help inform YPAG involvement in future research.

**Dispatch and triage**

**INTRODUCTION OF VIDEO TRIAGE OF CHILDREN WITH RESPIRATORY SYMPTOMS AT A MEDICAL HELPLINE**

1,2C Gren*, 3AB Hasselager, 2,4,5G Lindenthal, 6MS Frederiksen, 2,6,7Folk, 8AK Emball, 9H Gamst-Jensen, 1,2DP Cortes. 1Department of Pediatrics and Adolescence Medicine, Copenhagen University Hospital – Amager and Hvidovre, Copenhagen, Denmark; 2Department of Clinical Medicine, Faculty of Health and Medical Sciences, University of Copenhagen, Copenhagen, Denmark; 3Department of Pediatrics and Adolescence Medicine, Copenhagen University Hospital – Herlev and Gentofte, Copenhagen, Denmark; 4Department of Anesthesiology and Intensive Care, Copenhagen University Hospital – Bispebjerg and Frederiksberg, Copenhagen, Denmark; 5Copenhagen University Hospital – Copenhagen Emergency Medical Services, Copenhagen, Denmark; 6Department of Cardiology, Copenhagen University Hospital – Herlev and Gentofte, Copenhagen, Denmark; 7Department of Cardiology, Copenhagen University Hospital – Amager and Hvidovre, Copenhagen, Denmark; 8Department of Emergency Medicine, Copenhagen University Hospital – Amager and Hvidovre, Copenhagen, Denmark.

**Background** Calls regarding children make up the relatively largest proportion of contacts to medical call-centers, with calls often concerning respiratory symptoms. Triage of children without visual cues and through second-hand information is difficult, with risks of over- and undertriage. We aimed to test feasibility, acceptance and patient outcome after introduction of video triage of young children at the out-of-hours medical call-center in Copenhagen, Denmark.

**Method** Prospective quality improvement study, with patients aged 6 months to 5 years with respiratory symptoms enrolled to video or standard telephone triage (1:1). Calculated sample size was 774. The proportion of successful video calls, representing feasibility, and parental acceptance of video participation was registered, along with patient outcome within 48 hours, including adverse events (intensive care unit admittance, lasting injuries, death).

**Results** We included 617 patients (54% video triage) before the study prematurely was shut-down due to the COVID-19 pandemic. Feasibility was 95.2% and acceptance rate likewise 95.2%. No adverse events were registered in either group. Patients were triaged to stay at home in 63% of video triage calls vs. 58% of telephone triage calls (p=0.19). Within 8 and 24 hours there was a trend towards fewer video triaged than telephone triaged patients assessed at hospitals: 39% versus 46% (p=0.07) and 41% versus 49% (p=0.07), respectively.

**Conclusion** Video triage of young children with respiratory symptoms at a medical call-center was feasible, acceptable and safe. Video triage can potentially optimize triage and hospital referrals, and might be beneficial in many pediatric call-center contacts.

**Miscellaneous**

**A QUALITATIVE EXPLORATION OF RESTRAINT DECISIONS MADE BY PARAMEDICS AND ADVANCED PARAMEDICS IN THE CONTEXT OF ACUTE BEHAVIOURAL DISTURBANCE (ABD) IN THE PRE-HOSPITAL SETTING**

1J Lindridge*, 1L Blackwood, 2T Edwards. 1University of Bath, UK; 2London Ambulance Service NHS Trust, UK

**Background** Acute behavioural disturbance, also known as excited delirium, is a medical emergency. Paramedics are required to balance competing concerns, including the risks of restraint to the patient, the need for diagnostic accuracy and the need for compliance with relevant legislation. Decisions take place in the context of challenging situations and paramedics are required to work closely with other professionals, such as the police.

**Method** 17 semi structured interviews and focus group were undertaken with Paramedics and Advanced Paramedic Practi-
tioners. This data is being analysed using reflexive thematic analysis (Braun and Clarke, 2006), informed by critical realism.

**Results** We have identified five tentative themes: Professional identity and patient advocacy, adequacy of clinical
