ABSTRACT

Objective: To assess utilization of public and private healthcare, related healthcare expenditure, and associated factors for people with type 2 diabetes (T2D) and/or hypertension (HTN) and for people without those conditions in Cambodia.

Methods: A cross-sectional household survey.

Settings: Five operational districts in Cambodia.

Participants: Data was from 2,360 participants aged ≥ 40 years who had used healthcare services at least once in the three months preceding the survey.

Primary and secondary outcome: The main variables of interest were the number of healthcare visits and healthcare expenditure in the last three months.

Results: The majority of healthcare visits took place in the private sector. Only 22.0% of healthcare visits took place in public healthcare facilities: 21.7% in people with HTN, 37.2% in people with T2D, 34.7% in people with T2D plus HTN, and 18.9% in people without the two conditions (P -value <0.01). In people with T2D and/or HTN, increased public healthcare use was significantly associated with Health Equity Fund (HEF) membership and living in operational districts with *community-based care*. Furthermore, significant healthcare expenditure reduction was associated with HEF membership and using public healthcare facilities in these populations.

Conclusion: Overall public healthcare utilization was relatively low; however, it was higher in people with chronic conditions. HEF membership and *community-based care* contributed to higher public healthcare utilization among people with chronic conditions. Using public healthcare services regardless of HEF status reduced healthcare expenditure, but the reduction in spending was more noticeable in people with HEF membership. To increase public healthcare utilization among people with T2D and/or HTN, the public healthcare system should further

1
2
3 46 improve care quality, expand social health protection, and expand *community-based care* for this
4
5 47 population. However, these may require more time and resources. One potential strategy in the
6
7
8 48 short run is to partner the private sector with the public sector.

49 STRENGTHS AND LIMITATIONS OF THIS STUDY

- 50 ▪ Our study is among the few to examine healthcare utilization and expenditure among
51 people with two major chronic conditions type 2 diabetes (T2D) and/or hypertension
52 (HTN) in Cambodia, in comparison with the people without the two conditions.
- 53 ▪ The findings in this study provides could inform decision-makers about strategies for
54 T2D and HTN management in Cambodia and similar settings.
- 55 ▪ Our study is not representative for the national level as most of the study sites we selected
56 were rural or semi-rural.
- 57 ▪ We only calculated the healthcare expenditure for those who used the service in the three
58 months preceding the study, which cannot be generalized to the target population in the
59 study (people aged 40 years or older).

61 INTRODUCTION

62 Type 2 diabetes (T2D) and hypertension (HTN) are global public health concerns. They are major
63 risk factors for cardiovascular diseases, causing about 31% (17.9 million) of all deaths worldwide
64 annually.¹ The prevalence of people with T2D and/or HTN will likely continue to increase.^{2 3}
65 These two diseases disproportionately affect low- and middle-income countries and account for
66 around 75% of all deaths in these countries.¹

67 In Cambodia, large-scale population-based studies such as STEPS Surveys have shed light on the
68 prevalence and risk factors of chronic diseases. The prevalence of T2D and HTN rose noticeably
69 over recent years from 2.9% and 11.2% in the population aged 25–64 years in 2010 to 9.6% and
70 14.2% in the population aged 18–69 years in 2016, respectively.⁴

71 Previous nationally representative surveys have shown that a majority of the population seeks
72 outpatient curative care in private facilities, but knowledge on the related healthcare uptake and
73 expenditure among those with T2D and/or HTN is scarce.⁵ Additionally, these surveys do not
74 cover topics related to the management of the diseases, such as healthcare utilization and
75 expenditure.^{6 7} There is only one study by Bigdeli *et al.* which examines access to care for people
76 with T2D and/or HTN concerning social health protection schemes in Cambodia.⁸ This study
77 shows that 61% of the people with T2D and/or HTN who knew their status were diagnosed in
78 private facilities.⁸ However, this study collected data in 2013, before key interventions were
79 introduced or expanded in public healthcare facilities.⁹ Also, it provides limited information about
80 which types of health facilities were used, and what differences exist between people with one or
81 both conditions compared to those without.

82 In the last decade, the Cambodian Ministry of Health (MoH), in collaboration with development
83 partners, made significant efforts to improve the quality of public healthcare and initiated a few

1
2
3 84 healthcare delivery models for people with T2D and/or HTN in public facilities.⁹ These models
4
5 85 include *hospital-based care*, *health center-based care*, *community-based care* and a combination
6
7
8 86 of all three models (*coexisting care*) (Box 1). These efforts might have changed the pattern of
9
10 87 healthcare utilization and related expenditure, especially among people with T2D and/or HTN.

- The *hospital-based care* model is standard care, which means an operational district (OD) has a government-run Non-communicable Disease (NCD) clinic at the district referral hospitals.⁹ By 2021, 31 out of 117 referral hospitals had implemented this model.
 - The *health center-based care* model adopts the World Health Organization Package of Essential Non-communicable Disease Interventions (WHO PEN).⁹ In this model, the MoH added the function of a health center to *hospital-based care*. However, the coverage of health centers with the WHO PEN varies in each OD, which can be divided into low coverage (<50% of all health centers implement the WHO PEN; *health center-based care (low)*) and high coverage (\geq 50% of all health centers implement the WHO PEN; *health center-based care (high)*). The referral flow is slightly different between T2D and HTN. For T2D, this model identifies cases in the health centers through a screening test. If the patients are suspected of having T2D, health centers refer them to a diabetes clinic at a district referral hospital for confirmation of diagnosis. Once diagnosed, severe cases are treated in the hospital clinic, and stable or mild cases are followed up regularly at the health centers. For HTN, the health centers treat mild patients and refer the severe cases to the referral hospital. By 2021, *health center-based care* was implemented in 137 of 1,221 health centers.

- The *community-based care* model or peer education network established and run by MoPoTsyo, a local non-governmental organization.⁹ In this model, peer educators (PEs) are added to hospital-based care. MoPoTsyo trained people with T2D and/or HTN to be PEs. These PEs play a role in screening and referring those suspected of having T2D and/or HTN to seek medical consultation and treatment at the referral hospitals that MoPoTsyo has partnered with. The PEs also provide counseling on lifestyle changes and support self-management to registered network members. By 2019, this *community-based care* model had been implemented in 20 of 102 ODs in 8 of 25 provinces in Cambodia.^{9 10} It had 225 PEs to serve 40,000 people with T2D.¹⁰
- The *coexisting care* model comprises a combination of the above three models. At the time of the study until 2021, only one OD (Daunkeo) had this model.

90
91 A better understanding of the current patterns of healthcare utilization and expenditure among
92 people with T2D and/or HTN is critical for better targeting resources and strategies to improve
93 the management of T2D and HTN. The main objectives of this study are two-fold. First, it
94 evaluates usage and determines the factors associated with public healthcare use in four groups:
95 (1) people without T2D or HTN, (2) people with T2D alone, (3) people with HTN alone, and (4)
96 people with T2D plus HTN. Second, it assesses the healthcare expenditure in the three months
97 preceding the survey for all services used by the four patient groups in public and private
98 facilities and determines factors associated with (reducing or increasing) healthcare expenditure.

100 METHODS AND CONTEXT

101 Context

102 The health system in Cambodia is pluralistic, meaning healthcare services are provided by both
103 public and private healthcare providers.^{5 11}

104 *Public healthcare services* in Cambodia dominate preventive services (reproductive, maternal,
105 neonatal, and child health), control of primary disease (tuberculosis, malaria, and HIV/AIDS
106 control), and inpatient treatment.⁵ The facilities include health posts, health centers, district referral
107 hospitals, provincial referral hospitals, and national hospitals.⁵ Public healthcare is organized per
108 operational district (OD)—the third and last administrative level in Cambodia’s health system
109 management.⁵ An OD covers a population of 100,000–200,000 people while a health center covers
110 a population of 10,000–20,000 people.⁵ Remote areas with a small population can be covered by
111 a health post.⁵ The health post provides similar services to a health center, but it is smaller than a
112 health center.⁵ Each OD usually has one district referral hospital with a few ODs having two
113 district hospitals.⁵ The district referral hospital receives self-referred patients or those referred by
114 the health centers.

115 Alongside this public sector, a large *private healthcare sector*, which is more accessible than the
116 public sector, dominates outpatient curative care.⁵ Since 1994, the Cambodian government started
117 economic liberalization, permitting staff to work outside their government’s working hours and
118 own healthcare facilities.⁵ Since then, the private healthcare sector and dual practice, meaning
119 public healthcare workers also have private practices, have grown rapidly. In 2015, over 50% of
120 the healthcare workforce in private healthcare facilities were government personnel.⁵ The private
121 healthcare facilities range from cabinets, laboratories, pharmacies, clinics, and polyclinics to
122 hospitals.⁵ Cabinets are the smallest facilities with less than two beds and mainly provide medical

1
2
3 123 consultation services.^{12 13} According to the MoH Progress Report in 2018, over 90% of private
4
5 124 healthcare facilities were cabinets.^{12 13} The second most frequent facilities were clinics (3.2%),
6
7 125 providing medical specialties, laboratories, radiology services, and pharmacies.¹² A clinic has
8
9 126 between 10 and 20 beds.¹² In addition, buying medication in pharmacies or drugstores for self-
10
11 127 treatment without a doctor's prescription is common in Cambodia, although not permitted by
12
13 128 law.¹⁴

16
17 129 In terms of health expenditure, the public healthcare sector did not charge user fees until 1996.⁵ In
18
19 130 that year, the government also introduced a user-fee scheme for the public sector with fees
20
21 131 approved by the local community to increase healthcare quality at public healthcare facilities.^{5 15}
22
23 132 The revenue from the user-fee scheme could be used to incentivize staff and support ongoing
24
25 133 operations. However, the user-fee posed challenges for the poor to access public healthcare. To
26
27 134 address this, the MoH established the Health Equity Fund (HEF) in 2000, a pro-poor social health
28
29 135 protection scheme.¹⁶ The HEF is linked to the implementation of identification of the poor (known
30
31 136 as "IDPoor").¹⁷ It is intended for the "extremely poor" or "poor" category, which is assessed and
32
33 137 verified by the local authorities.¹⁷ People with IDPoor are entitled to the HEF, meaning that they
34
35 138 receive free healthcare services at public healthcare facilities and transportation expenditure
36
37 139 reimbursement.¹⁷ By 2019, the HEF covered approximately three million or about 20% of
38
39 140 Cambodia's population.¹⁶ Another scheme was the National Social Security Fund (NSSF),
40
41 141 established in 2007.¹⁸ The NSSF covers work and non-work-related illnesses and injuries for
42
43 142 formally employed people.¹⁸ Formal employers are mandated to pay for their staff's NSSF
44
45 143 membership. The NSSF had enrolled over 1.7 million employees or about 11% of the population
46
47 144 by 2019.¹⁹

1
2
3 145 However, it is important to note that several studies have indicated that the private sector
4
5 146 constitutes a significant source for out-of-pocket expenditure (OOPE).^{20 21} Between 2009 and
6
7 147 2016, around 60% of health expenditure was OOPE while the rest was a combination of the
8
9 148 government's and development partners' budgets. The OOPE per capita increased slightly from
10
11 149 USD 40.6 in 2009 to USD 48.1 in 2016.²¹ In 2016, 76.6% of the total OOPE was linked to private
12
13 150 healthcare.^{20 21}
14
15
16
17
18

19 152 **Data sources**

20
21 153 This study is part of a larger cross-sectional household survey, with the primary aim of
22
23 154 developing a care cascade for T2D and HTN.
24
25
26
27

28 156 **Settings**

29
30 157 The study purposively selected five ODs. The selection was made to include different T2D
31
32 158 and/or HTN care models piloted in Cambodia: *coexisting care*, *community-based care*, *health-*
33
34 159 *center based care (high)*, *health-center based care (low)*, and *hospital-based care* (Box 1).
35
36

37 160 The five ODs in which the study took place are out of 103 ODs in the country and located in five
38
39 161 different provinces. The map of ODs is presented in Annexure 1. These ODs have similar road
40
41 162 infrastructure improvements, in which poor road conditions are no longer a barrier to accessing
42
43 163 healthcare.
44
45

- 46
47 164 ▪ *OD Daunkeo, Takeo province*: This OD had the “*coexisting care*” model. At the time of
48
49 165 the study, it was the only OD in which the three care models coexisted. The catchment
50
51 166 area included Takeo town and a large rural area. Its NCD clinic was established in 2002,
52
53 167 and the peer educator network was initiated in 2007 and handed over to the MoH in
54
55
56
57
58
59
60

1
2
3 168 2015.²² The WHO PEN was implemented in 5 out of 14 health centers since 2015. The
4
5 169 private services for people with T2D and/or HTN may also be easily accessible.

6
7
8 170 ■ *OD Kong Pisey, Kampong Speu province*: This OD had the “community-based care”
9
10 171 model. It has a strong MoPoTsyo network to provide T2D and HTN care to patients.

11
12 172 Located about 54 kilometers from the capital of Phnom Penh, this OD is semi-urban with
13
14 173 a variety of private facilities.

15
16
17 174 ■ *OD Pearaing, Prey Veng province*: This OD had the “health center-based (high)” model,
18
19 175 and was the OD with high coverage of the WHO PEN. Six out of nine health centers in
20
21 176 this OD have been piloting the WHO PEN since 2015. Due to dual practice, the high
22
23 177 coverage of the WHO PEN also facilitates accessible private services for people with
24
25 178 T2D and/or HTN.

26
27
28 179 ■ *OD Sot Nikum, Siem Reap province*: This OD had the “health center-based (low)”
29
30 180 model, and was the OD with low coverage of the WHO PEN (6/25 of the health centers
31
32 181 started the WHO PEN in 2018). This OD has been historically and significantly
33
34 182 influenced by the financial support of various development partners, and services for
35
36 183 people with T2D and/or HTN have been well arranged at its NCD clinic.²³

37
38 184 ■ *OD Samrong, Oddar Meanchey province*: This OD had a “hospital-based care” model. It
39
40 185 had an NCD clinic without the WHO PEN and peer educator network. A large part of the
41
42 186 catchment is a remote area bordering Thailand, approximately 470 kilometers from the
43
44 187 capital. Therefore, the private services for people with T2D and/or HTN may not be
45
46 188 broadly accessible.

189

Samples

191 The larger household survey recruited 5,072 individuals aged 40 years or older to participate in
192 the study using a multi-stage cluster sampling method. Initially, it purposively chose five ODs
193 with different care models for T2D and HTN. Second, 44 villages per OD were randomly
194 selected, regardless of the population size of each OD. The purpose of this equal probability
195 selection was to over-sample participants in ODs with a smaller population so that they would
196 have an adequate sample for each care model. Third, 24 households in each village were selected
197 by probability systematic sampling, and finally, one person aged 40 years or older per household
198 was selected at random. To minimize the non-response rate, which can unintentionally exclude a
199 certain group of the target population from the survey, the selected participants were called back
200 or followed-up three times when they were absent from their household. If the attempt failed,
201 another household in the next row in the sampling list was selected. Then, the procedure
202 described above was repeated. The equal probability selection at the village and household levels
203 were used with the OD level's same purpose.

204 To correspond to our analytical objective, we used a subset of this sample: we only retained
205 those who reported using healthcare services at least once in the three months preceding the
206 survey (Figure 1). A total of 2,360/5,072 participants met this criterion. The 2,360-participant
207 sample subset included four patient groups: 1,331 people without T2D and HTN, 761 people
208 with HTN alone, 109 people with T2D alone, and 159 people with T2D plus HTN.

209

1
2
3 **Figure 1. Data flow from household selection to final dataset in this study,**
4
5 **Cambodia, 2020**
6

7
8
9 **Data collection**
10

11 The data collection took place between July and October 2020. The data collection was
12
13 conducted in three steps following the WHO's STEPS Survey approach: (1) interviews with a
14
15 structured questionnaire, (2) anthropometric measurements, and (3) biochemical measurements.⁶
16
17

18 ⁷ Since our study only focuses on healthcare utilization and expenditure, we only used
19
20 information from step 1—interviews with a structured questionnaire. The questionnaire was
21
22 tablet-based and comprised of 11 sections, including socio-demographic information, health
23
24 status and quality of life, healthcare utilization, social support, lifestyle or behavior measures,
25
26 physical activity, diabetes and hypertension knowledge, medication adherence, self-management
27
28 support, and decision-making power on food. However, we only used two sections in our
29
30 analysis: socio-demographic information and healthcare utilization.
31
32

33
34 The tablet-based questionnaire was installed using the Kobo Toolbox
35
36 (<https://kf.kobotoolbox.org>), an open-source software with a free-of-charge server and online
37
38 storage.²⁴
39
40

41 **Measures**
42

43 This study's primary variable of interest is the number of visits to public and private facilities.
44
45 By public healthcare facilities, we refer to government-run facilities that provide medical
46
47 services, and include national hospitals, provincial referral hospitals, district referral hospitals,
48
49 health centers, and health posts. A health post is similar to a health center, and only a few exist in
50
51 remote areas. Therefore, we grouped them with health centers. Private healthcare services are
52
53 non-government organizations that provide medical and non-medical services, and include
54
55
56
57
58
59
60

234 private hospitals, private clinics, pharmacies, homes of trained health workers, and visits of
235 health workers to the patients' homes. Traditional healing/medicine and using healthcare services
236 abroad have also been included in this category.

237 The secondary variable of interest was healthcare expenditure, the lump sum expenditure of
238 medical consultation, treatment, and medication. These data were obtained from the interview
239 with the participants. They were asked about their use of health services in the three months
240 preceding the survey (where they went, how often they went to a particular type of healthcare
241 facility, and how much they spent in each facility in those three months). We include the
242 questionnaire in Annexure 2. The Cambodian currency (riels) was converted into USD at an
243 exchange rate of 4,000 riels per USD. The expenditure does not include other spendings such as
244 on transport, food, or guesthouses/hotels.

245 To better understand the profile of people using public or private healthcare facilities, we
246 estimated associations between the use of public and private healthcare services and patient
247 characteristics such as sex (male, female), age (40–49, 50–59, 60+ years old), educational level
248 (none, primary, secondary or higher), social protection status (NSSF (yes, no), HEF (yes, no)),
249 wealth quintile (poorest, poor, medium, rich, richest), type of care models (*hospital-based*, *health*
250 *center-based (high)*, *health center-based (low)*, and *community-based*). The details on wealth
251 quintile calculation (socio-economic class) are described in Annexure 3.

252

253 **Analysis**

254 **Healthcare utilization**

1
2
3 255 Taking the number of visits as a dependent variable, we report the healthcare visit rate to public
4
5 256 and private facilities over the three months preceding the survey, then stratified by patient
6
7
8 257 groups.

9
10 258 To identify the independent factors associated with healthcare utilization (defined by the number
11
12 259 of visits), we first used bivariate negative binomial regression to identify the potential factors in
13
14 260 the five groups—overall and four patient groups—separately. Variables with a P -value <0.25 in
15
16 261 at least one of the four patient groups or overall group were included in the multiple negative
17
18 262 binomial regression. The exposure variable (total healthcare visits of each participant) was
19
20 263 incorporated into this model. Variables with a P -value <0.05 were considered statistically
21
22 264 significant in this final model. The negative binomial regression was chosen over Poisson
23
24 265 regression because the number of visits was over-dispersed.
25
26
27
28
29 266

30 267 Medical expenditure

31
32
33 268 We took healthcare expenditure in the three months preceding the survey as the dependent
34
35 269 variable. Due to the limitation of our data, we focused more on assessing the factors associated
36
37 270 with healthcare expenditure and did not explore the overall medical expenditure. We reported the
38
39 271 overall arithmetic mean and then stratified the mean by patient groups. The expenditure was
40
41 272 calculated separately for each patient group. Because arithmetic means can be easily affected by
42
43 273 extremely high values, we removed the values above the 90th percentile, which we believe were
44
45 274 too high in our sample.
46
47
48

49 275 Our analysis was carried out in three steps to separately identify the independent factors
50
51 276 associated with healthcare expenditure in the four patient groups. First, a logarithmic
52
53 277 transformation of the medical expenditure was performed as the data was skewed to the right.
54
55
56
57
58
59
60

1
2
3 278 Second, in the bivariate analysis, we compared the geometric mean of healthcare expenditure by
4
5 279 characteristics of the participants. This analysis identified the variables potentially associated
6
7 280 with the healthcare expenditure at a P -value <0.25 . During this phase, the Student's t -test for
8
9 281 binary explanatory variables and the one-way ANOVA test for non-binary explanatory variables
10
11 282 were used. Variables with a significant level at a P -value <0.25 in any patient group were
12
13 283 included in the multiple linear regression. Third, multiple linear regression was performed and
14
15 284 the coefficient and 95% confidence interval (CI) values were exponentiated to a risk ratio (RR)
16
17 285 for better interpretation.
18
19 286 Data were analyzed using Stata 16.0 (Stata Corp LLC, College Station, Texas 77, USA), and R
20
21 287 programing's GGLOT2 package was used to produce the graphs.
22
23
24
25
26
27

28 289 **Ethical approval**

29
30
31 290 The protocol was approved by the National Ethics Committee for Human Research (NECHR) on
32
33 291 April 29, 2019 (No. 105 NECHR) and by the Institutional Review Board of Institute of Tropical
34
35 292 Medicine (Antwerp) on October 25, 2019 (No. 1,323/19). All participants provided their consent
36
37 293 and volunteered to take part in the study.
38
39
40
41

42 295 **Patient and public involvement**

43
44 296 No patient was involved in the development of the research question and outcome measures,
45
46 297 study design, and study participant recruitment. The findings are not disseminated to the study
47
48 298 participants.

300 RESULTS

301 Characteristics of participants

302 Our analysis included 2,360 participants, including 1,331 people without T2D or HTN, 761
 303 people with HTN alone, 109 with T2D alone, and 159 with T2D plus HTN. The other
 304 participants were excluded because they had not used healthcare services in the three months
 305 preceding the survey (N=2,703) or had a missing response to the primary variable of interest
 306 (N=9).

307 Females were more prevalent in all patient groups, especially in the T2D plus HTN group. The
 308 age range was between 40 and 96 years, with people with HTN and T2D plus HTN having a
 309 significantly higher average age than those without the two conditions. The majority of
 310 participants did not attend school or attended only primary school.

311 Regarding the social health protection scheme, a small proportion of participants in all groups
 312 had the NSSF membership (4.8% overall). A larger proportion of patients across all groups had
 313 the HEF membership (18.4% overall).

319 *PEN*

320

321 **Public and private healthcare utilization**

322 The 2,360 individuals reported 6,645 visits to the healthcare facilities in the three months

323 preceding the survey, averaging 2.8 visits per person over three months.

324 Figure 2 presents the proportion of visits to public and private healthcare facilities. At the facility

325 level, as shown in Figure 2A, the largest share was accounted for by private clinics (28.5%),

326 followed by visits to the private homes of nurses or doctors (15.6%), private pharmacies

327 (15.3%), health centers (12.6%), and private hospitals (11.6%).

328 The common public healthcare facilities used by participants with T2D and T2D plus HTN were

329 provincial/national and district referral hospitals (Figure 2A). Approximately 29.7% of visits

330 from people with T2D and 29.6% from people with T2D plus HTN went to provincial/national

331 and district hospitals (Figure 2A). These proportions were higher than 6.9% for people without

332 T2D or HTN and 6.1% for HTN only.

333 Overall, the private sector occupied about 78.0% of the total visits, and the public sector

334 occupied 22.0% (Figure 2B). All groups visited private healthcare facilities more frequently than

335 public healthcare facilities (Figure 2). However, the frequency of visiting public facilities was

336 statistically higher in people with T2D and T2D plus HTN. As shown in Figure 2B, 37.2% of
 337 visits from people with T2D and 34.7% of visits from people with T2D plus HTN were to public
 338 healthcare facilities, compared with 18.9% of visits from people without the two conditions and
 339 21.7% of the visits from people with HTN (P -value<0.001).

341 Figure 2. Proportion of visits to public and private facilities in Cambodia, 2020

343 Public healthcare utilization by participant characteristics

344 Table 2 compares the public healthcare facility user rates defined as the proportion of public
 345 healthcare visits over total visits (public visits plus private visits). The user rates were
 346 disaggregated by participant characteristics. In this bivariate analysis, age, NSSF, HEF, wealth
 347 quintile, and care model were significantly associated with public healthcare utilization at a P -
 348 value<0.25 in at least one patient group. Therefore, we included these variables in the multiple
 349 negative binomial regressions.

350 Table 2. Proportions of visits to public facilities by participant characteristics, 2020, Cambodia

Abbreviation: NSSF, National Social Security Fund; HEF, Health Equity Fund

Note:

- The % of private healthcare is not presented in this table but can it be calculated by subtracting the % of the public healthcare from 100%.
- Health center-based (high) means the OD with high coverage (six out of nine) of health centers with the WHO PEN; Health center-based (low) means the OD with low coverage (six out of 25) of health centers with the WHO PEN
- "N" denotes the total of visits.
- *P*-values < 0.25 are in bold, indicating a significant level at 0.25. Variables with *P*-value < 0.25 were included in multivariate analysis.

Table 3 presents the results of the multiple negative binomial regressions. Overall, the significant increase in public healthcare use was associated with having T2D and T2D plus HTN, living in the OD with *coexisting care*, and HEF membership.

In people without T2D or HTN, HEF membership was significantly associated with public healthcare use: adjusted incidence rate ratio (AIRR) of 1.4 [95% CI 1.0–2.0], *P*-value < 0.05). We did not observe the same association in the other three groups.

369 In people with HTN, the poorest category was significantly associated with increasing public
 370 healthcare use with an AIRR of 2.1 [95% CI 1.1–4.0], P -value=0.02), compared to those in the
 371 richest category. Nevertheless, the same association was not seen in other patient groups.
 372 Regarding the care model, in people with T2D, the OD with *community-based care* (AIRR 3.7
 373 [95% CI 1.2–11.3], P -value=0.019) and the OD with low coverage of *health center-based care*
 374 (AIRR 3.3 [95% CI 1.1–9.8], P -value=0.036) were significantly higher in public healthcare use
 375 than in the OD with *hospital-based care*.
 376 In people with T2D plus HTN, the OD with *coexisting care* was associated with higher public
 377 healthcare use (AIRR 4.0 [95% CI 1.2–12.9], P -value=0.020).

Healthcare expenditure

19

20

21 389

Medical cost per year, overall and by facility

22

23 390

Overall, those who used healthcare spent an average of USD 25.3 [95% CI 22.9–27.6] for all

24

25 391

healthcare services in the three months preceding the survey (Figure 3).

26

27 392

When comparing patient groups, people with T2D plus HTN had the highest healthcare

28

29 393

expenditure with an average of USD 43.6 [95% CI 29.7–57.2], followed by people with T2D

30

31 394

with an average of USD 34.0 [95% CI 25.5–42.6]. These expenditures were statistically higher

32

33 395

than the average of USD 17.1 [95% CI 13.1–21.1] in people with HTN and the average of USD

34

35 396

26.9 [95% CI 23.9–29.9] in people without the two conditions with a P -value<0.001.

(public vs. private), and care model were statistically associated with healthcare expenditure in one or more patient groups with a P -value <0.25 . These variables were included in the multiple linear regression.

Table 5 presents results from multiple linear regression. Overall, having T2D or T2D plus HTN, being female, having reported using both private and public healthcare, and living in the OD with *community-based care* was significantly associated with increased healthcare expenditure. In contrast, holding HEF membership and using public healthcare was significantly associated with healthcare expenditure reduction.

At the group level, in people without the two conditions, HEF membership was significantly associated with a reduction in healthcare expenditure with an adjusted risk ratio (ARR) of 0.7 [95% CI 0.5–0.8], P -value <0.001). The same association was seen in people with HTN (ARR of 0.8 [95% CI 0.6–1.0], P -value <0.01), and in T2D plus HTN (ARR of 0.3 [95% CI 0.2–0.6], P -value <0.001). However, the association was not observed in people with T2D.

In people without the two conditions, using public healthcare was significantly associated with a reduction in the expenditure (ARR of 0.3 [95% CI 0.2–0.3], P -value <0.001). The association was also found in people with HTN (ARR 0.4 [95% CI 0.3–0.5], P -value <0.001).

People with T2D plus HTN who resided in the OD with *community-based care* were significantly associated with a higher expenditure with an ARR of 2.0 [95% CI 1.1–3.8], P -value <0.01) than those with *hospital-based care*.

Table 4 Factors associated with reducing or increasing healthcare expenditure in 2020, Cambodia

428 Abbreviation: ARR, adjusted risk ratio; CI: confidence interval; Ref., reference group; OD, operational district

429 Note: Health center-based (high) means the OD with high coverage (six out of nine) of health centers with the WHO

430 PEN; Health center-based (low) means the OD with low coverage (six out of 25) of health centers with the WHO

431 PEN; P -values<0.05, <0.01, <0.001 are in bold, indicating the variables are significantly associated with

432 expenditure

433

434

435 **DISCUSSION**

436 The results show that the use of the public healthcare system remains low for all groups in our
437 study, with about one in every five healthcare visits taking place in the public sector overall.

438 People with chronic conditions, HEF membership, living in the OD with *community-based care*
439 contributed to public healthcare uptake. The healthcare expenditure was significantly reduced
440 when patients used public healthcare services, regardless of HEF membership. However, the
441 reduction in spending was more noticeable in people with HEF membership. In contrast,
442 expenditure was higher among patients living in the OD with *community-based care*.

443 People in Cambodia predominantly used healthcare in private facilities for outpatient curative
444 care.²¹ Our study showed that this is also the case for people with chronic conditions such as
445 T2D and HTN although this group had a slightly higher rate of using public healthcare services.

446 This result is congruent with earlier findings that approximately 61% of T2D and/or HTN
447 patients received their initial diagnosis in private settings.⁸ A qualitative study in Cambodia
448 suggested that people with T2D did not prefer diabetes services at public facilities because they
449 were less accessible due to geographical factors or distance and limited medication supply.²⁵ Our
450 findings suggest that healthcare quality and access to public healthcare services is still below the
451 expectations of people. To increase public healthcare utilization, efforts need to be made to
452 expand the coverage and quality of T2D and HTN services in public healthcare facilities.

453 However, this may require time and resources, which will have budget implications, while
454 Cambodia may not be able to increase the budget for health more than its economic growth rate
455 of about 7% per year.²⁶ Another approach could be to recognize the role of private healthcare
456 providers and include them in the coverage schemes. This would mean that they are required to

1
2
3 457 comply with government policies and regulations. The practical, financial, legal, and political
4
5 458 implications of such strategies need to be examined.
6

7
8 459 Previous studies revealed that HEF membership contributed to the health service uptake at public
9
10 460 facilities and reduced healthcare expenditure in general users.^{16 27} Our findings extended the
11
12 461 understanding that HEF membership has also increased public healthcare use and substantially
13
14 462 reduced healthcare spending among people with T2D and/or HTN. Since HEF benefits are only
15
16 463 available in public healthcare facilities, it is not surprising that it also contributes to increasing
17
18 464 service uptake in public facilities. These findings suggest that HEF membership should be
19
20 465 expanded among people with chronic conditions, alongside with improving service coverage and
21
22 466 quality. By doing so, the health services with quality for people with T2D and/or HTN will be
23
24 467 more accessible with fewer financial barriers.
25
26

27
28 468 *Community-based care* contributed to the higher public service uptake among T2D and/or HTN,
29
30 469 but it also contributed to the higher expenditure for the users. In ODs with this model, PEs refer
31
32 470 patients to the public referral hospitals, so it is not surprising that the public service uptake is
33
34 471 slightly higher than other ODs.²⁸ However, it is somewhat surprising that people with T2D
35
36 472 and/or HTN in the OD with *community-based care* spent more on their health services. This may
37
38 473 be explained by higher unit costs spent by the supply side in *community-based care* to operate
39
40 474 their services, so the patients are charged a higher fee than other models. Our team had
41
42 475 conducted a costing study in 2020 to examine the costs to operate services by different care
43
44 476 models. The study found that the unit costs were higher for T2D and HTN patients in the
45
46 477 *community-based care* than the *hospital-based care* (USD 101 vs. USD 77 for a T2D patient and
47
48 478 USD 83 vs. USD 55 for an HTN patient). The higher unit costs in the *community-based care*
49
50 479 were driven by adding PE components and field activities to the model. The investment in
51
52
53
54
55
56
57
58
59
60

1
2
3 480 *community-based care* leads to better treatment outcomes, but it is not explored in our study. A
4
5 481 previous study provided limited information that a significant proportion of patients in the
6
7 482 *community-based care* network had achieved fasting blood glucose goals of 126 mg/dl, from
8
9 483 10% to 45%, and blood pressure goals of 140/90 mm Hg, from 58% to 67%, after a 12-month
10
11 484 follow-up.²² This study, however, did not have a control group (patients outside the network).
12
13 485 From this, we can learn two things. First, the adapting and scaling up of PEs should be done with
14
15 486 a careful budget plan as PEs incur operational costs. Second, a study investigating the treatment
16
17 487 outcomes between different care models and cost-effectiveness remains the gap in Cambodia and
18
19 488 should be conducted for a better decision.
20
21 489 There are several strengths in our study. First, our study is among the few to examine healthcare
22
23 490 utilization and expenditure both among people with T2D and/or HTN and people without the two
24
25 491 conditions. It furthermore covers both the public and private sectors. This broad scope renders
26
27 492 the results useful to inform T2D and HTN interventions in Cambodia. Second, we covered a
28
29 493 wide range of ODs with different care models and geographically dispersed, which means that
30
31 494 our participants are heterogeneous. Third, the data collection was robust and ensured a reliable
32
33 495 data set.
34
35 496 Our study also had its limitations. First, it may not represent the national level as most of the
36
37 497 study sites (villages) we selected were rural or semi-rural, which may lead to overestimating the
38
39 498 healthcare utilization in public facilities. Second, the ODs were purposively selected with
40
41 499 oversampling the OD with interventions, increasing the service uptake in public facilities. This
42
43 500 may lead to overestimating the public healthcare use in our study. Third, we only calculated the
44
45 501 healthcare expenditure for those who used the service in the three months preceding the survey,
46
47 502 which cannot be generalized to the target population in the study (people aged 40 years or older).
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 503 However, it is unlikely to be significant because we focused more on factors associated with
4
5 504 increasing or reducing healthcare expenditure. Fourth, the sample size may be relatively small
6
7
8 505 when we stratified them into four groups. Therefore, variables that were not significantly
9
10 506 associated with the dependent variables in our study may be due to the insufficient sample size.
11
12
13 507

14 508 **CONCLUSION**

15
16
17 509 Healthcare utilization at public healthcare facilities is relatively low for all groups; however, it is
18
19 510 higher in people with chronic conditions. HEF membership and *community-based care*
20
21 511 contributed the higher public healthcare utilization in people with chronic conditions. Using
22
23 512 public healthcare services regardless of HEF status reduced the healthcare expenditure, but the
24
25 513 reduction in spending was more noticeable in people with HEF membership. To increase public
26
27 514 healthcare utilization among people with T2D and/or HTN, the public healthcare system should
28
29 515 further improve care quality, expand social health protection, and expand community-based care
30
31 516 for this population. However, these may require more time and resources. One potential strategy
32
33 517 in the short run is to partner the private sector with the public sector. Future research should link
34
35 518 healthcare use and expenditure across different healthcare models to actual treatment outcomes
36
37
38 519 to denote areas for further investment.

BMJ Open: first published as 10.1136/bmjopen-2022-061959 on 12 January 2023. Downloaded from <http://bmjopen.bmj.com/> on April 18, 2024 by guest. Protected by copyright.

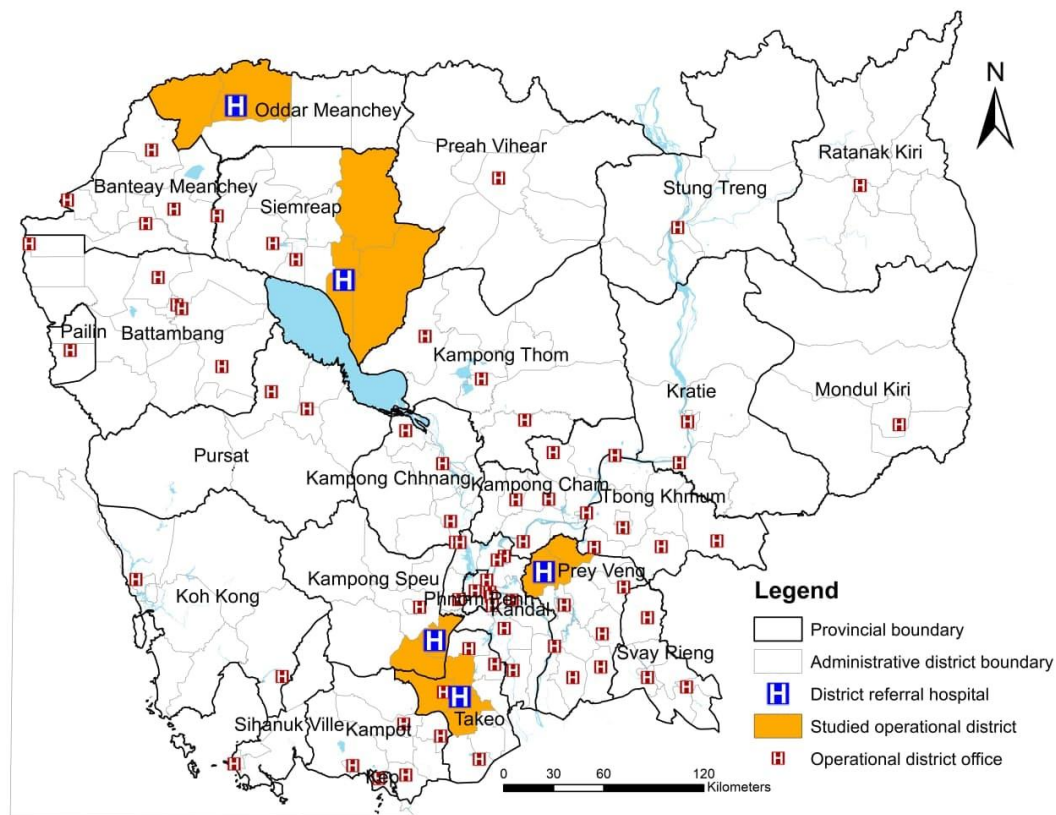

Figure 3. Healthcare expenditure by patient groups in the three months preceding the survey in 2020, Cambodia

254x177mm (300 x 300 DPI)

Annexure 1. Locations of the five studied ODs in Cambodia, 2020.

Annexure 2. Principal Component Analysis

The wealth quintile was used to classify participants into five socio-economic classes: poorest, poor, medium, rich, and richest. The wealth quintile was constructed using principal component analysis (PCA). The head of the family or family representative was interviewed using a 30-item tool that was taken from the 2014 Cambodia Demographic Health Survey. The tool is designed to classify households' wealth based on their properties. The binary answer questions were coded with 0 for no and 1 for yes. The questions with non-binary-answer were split into binary questions with a code of 0 for no and 1 for yes [21]. The first score component was used to classify the wealth into five quintiles [21]. The lower score represents the poorer status, and the higher score represents the richer status. The list of questions used for PCA is in the table below.

HOUSEHOLD SOCIO-ECONOMIC STATUS

<i>QH3. Does your household have? [CDHS]</i>		
301. electricity	1=Yes	0=No
302. a radio?	1=Yes	0=No
303. a television?	1=Yes	0=No
304. a mobile telephone?	1=Yes	0=No
305. If yes, is it a smartphone?	1=Yes	0=No
306. a refrigerator?	1=Yes	0=No
307. a wardrobe?	1=Yes	0=No
308. a sewing machine or loom?	1=Yes	0=No
309. CD/DVD player?	1=Yes	0=No
310. a generator/battery/solar panel?	1=Yes	0=No
Does any member of your household own/have ? [CDHS]		
311. a watch?	1=Yes	0=No

312. a bicycle or cyclo?	1=Yes	0=No
313. a motorcycle or motor-scooter?	1=Yes	0=No
314. a motorcycle-cart	1=Yes	0=No
315. a oxcart or horsecart?	1=Yes	0=No
316. a car or truck, tractor or van?	1=Yes	0=No
317. a boat with a motor?	1=Yes	0=No
318. a boat without a motor?	1=Yes	0=No
319. any agricultural land?	1=Yes	0=No
320. any livestock, herds, other farm animals, or poultry?	1=Yes	0=No
321. a bank account?	1=Yes	0=No

322	What is the main material of the floor? <i>Record observation</i>	<ol style="list-style-type: none"> 1. Earth/sand/clay 2. Dung 3. Wood planks 4. Palm/bamboo 5. Parquet or polished wood 6. Vinyl or Asphalt strips 7. Ceramic tiles 8. Cement tiles 9. Cement 10. Floating house 11. Other (specify)
323	What is the main material of the roof? <i>Record observation</i>	<ol style="list-style-type: none"> 1. Bamboo/thatch/palm leaf 2. Rustic mat 3. Wood planks 4. Cardboard 5. Plastic sheet 6. Metal 7. Wood 8. Calamine/cement fiber 9. Ceramic tiles 10. Clay tiles 11. Cement 12. Other (specify)
324	What is the main material of the exterior walls? <i>Record observation</i>	<ol style="list-style-type: none"> 1. Palm/bamboo/thach 2. Dirt 3. Bamboo with mud 4. Straw with mud 5. Stone with mud 6. Uncovered adobe

		<ol style="list-style-type: none"> 7. Plywood 8. Cardboard 9. Reused wood 10. Metal 11. Cement 12. Stone with lime/cement 13. Bricks 14. Cement blocks 15. Covered adobe 16. Wood planks/shingles 17. Other (specify)
325	How many rooms in this household are used for sleeping?	Rooms:.....
326	What is the main source of drinking water during the wet season for members of your household?	<ol style="list-style-type: none"> 1. Piped into dwelling 2. Piped to yard/plot 3. Public tap/standpipe 4. Tube well or borehole 5. Protected well 6. Unprotected well 7. Protected spring 8. Unprotected spring 9. Rainwater 10. Tanker truck 11. Cart with small tank 12. Surface water (river/dam/lake/pond/stream/canal/irrigation channel) 13. Bottled water 14. Other (specify)
327	What is the main source of drinking water during the dry season for members of your household?	<ol style="list-style-type: none"> 1. Piped into dwelling 2. Piped to yard/plot 3. Public tap/standpipe 4. Tube well or borehole 5. Protected well 6. Unprotected well 7. Protected spring 8. Unprotected spring 9. Rainwater 10. Tanker truck 11. Cart with small tank 12. Surface water (river/dam/lake/pond/stream/canal/irrigation channel) 13. Bottled water 14. Other (specify)

328	Do you do anything to the water to make it safer to drink?	<ol style="list-style-type: none"> 1. Yes, always 2. Yes, sometime 3. No 4. Don't know
329	<p>What do you usually do to make the water safer to drink?</p> <p><i>Record all mentioned.</i></p>	<ol style="list-style-type: none"> 1. Boil 2. Add bleach/chlorine 3. Strain through a cloth 4. Use water filter (ceramic/sand/composite/etc.) 5. Solar disinfection 6. Let it stand and settle 7. Other (specify)
330	What kind of toilet facility do members of your household usually use?	<ol style="list-style-type: none"> 1. Flush to piped sewer system (not shared with other households) 2. Flush to septic tank (not shared with other households) 3. No facility/bush/field 4. Other type of toilet (specify)

Annexure 3. Individual Survey Questionnaire

INTRO:

Hello, my name is ____ and I am from the National Institute of Public Health. You has been randomly selected to participate in this study [on the scaling up of diabetes and hypertension in Cambodia] based on information from your household. The information you give will be kept confidential and no personal details will appear in any record. This interview will take approximately 60 minutes. You do not have to answer any question you don't want to and you can stop the interview at any time. There will also be measurements of your blood pressure, weight and height, waist and hip circumferences during and after the interview, and for tomorrow early morning we would like to test your fasting blood glucose [HbA1c and creatinine level for known and suspected diabetes cases]. We very appreciate your participation and information.

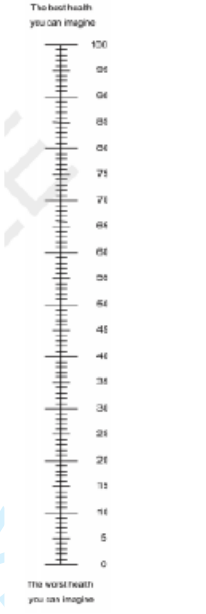

ELIGIBILITY & RECRUITMENT CHECK				
(Instructions: To be filled in by data collectors before participants sign informed consent)				
Q.N	Description & questions	RESPONSE		Ref:
Q1	Has the individual been a usual member of the household and stayed in the household the night before the interview or had not been absent for more than 6 months?	0 = No	1 = Yes	CDHS
Q2	Is the individual 40 or more than 40 of age? <i>IF POSSIBLE, CHECK ID CARD</i>	0 = No	1 = Yes	WHO PEN SOP
	If NO, DO NOT continue.			
Q3	Is the individual physically and mentally capable to answer the questions?	0 = No	1 = Yes	
	If NO, DO NOT continue			
Q4	Are you willing to participate in the study?	0 = No	1 = Yes	
	If NO, DO NOT continue If YES, CONSENT obtained			
Q5. Consent obtained		0 = No	1 = Yes	

SECTION 1: SOCIO-DEMOGRAPHIC INFORMATION					
Q.N	Description & questions	RESPONSE	Type of Variable	Field	Ref:
Q6	How old are you? <i>-Record in years as stated by the participant</i> <i>-Record 99 if don't know</i>	_____ Years	Quantitative discrete	Age	WHO STEPS
Q7	Sex of participant <i>Record sex of the participant as observed</i>	1 = Male 2 = Female	Categorical binary	Sex	WHO STEPS
Q8	What is your marital status?	1=Married or living together 2=Divorced or separated 3=Widowed	Categorical nominal	Marital Status	CDHS

	<i>-Record 88 if refuse to answer</i>	4=Never married and never lived together			
Q9	What is your highest educational level? <i>Record 99 if don't know</i>	1=No formal schooling 2=Less than primary school 3=Primary school 4=Secondary school 5=High school 6=College/University 7=Post graduate degree	Categorical ordinal	Educational level	WHO STEPS
Q10	What is your ethnic group?	1 = Khmer 2 = Vietnamese 3 = Chinese 4 = Cham (Muslim) 5 = Other	Categorical nominal	Ethnicity	WHO STEPS
Q11	Which of the following best describes your main work status within the past 12 months? <i>Record 88 if refuse to answer</i>	1=Household tasks 2=Civil servant 3=Employee of private company/NGO 4=Self-employed farmer 5=Large-scale farmer with employees 6=Self-employed in small business 7=Running a big business with employees 8=Casual worker 9=Working abroad 10=At school (pupil/student) 11=Unemployed or not eligible 12=Retired	Categorical nominal	Occupation	CDHS
Q12	Taking the past year, can you give an estimate of your annual income if I read some options to you? <i>Record 88 if refuse to answer</i>	1 = no earnings 2 = less than or 250 USD 3 = more than 251- 1500 USD 4 = more than 1501 – 3500 USD 5 = more than 3501 USD	Categorical ordinal	Individual income	WHO STEPS

SECTION 2: HEALTH STATUS AND QUALITY OF LIFE

Q.N	Description and Questions	Response	Type of Variable	Field	Ref:
-----	---------------------------	----------	------------------	-------	------

Q13	<p>At this point of time in your life, how would you describe:</p> <p>Q 13.1. Your home situation [____] Q 13.2. Your family relationships [____] Q 13.3. Your finances [____] Q 13.4. Your work situation [____]</p> <p><i>-Record 99 if don't know and 88 if refuse</i></p>	<p>1 = Excellent 2 = Very good 3 = Good 4 = Fair 5 = Poor</p>	Categorical Ordinal	QoLife	GACD book
Q14	<p>How good or bad is your health today?</p> <p><i>-The scale is numbered from 0 to 100. -100 means the best health you can imagine. -0 means the worst health you can imagine. -Please mark an X on the scale to indicate how your health is today.</i></p> <p><i>-Record 99 if don't know and 88 if refuse</i></p>		Quantitative discrete	Gen. Health	EuroQoL
Q15	<p>Have you ever been told by a doctor or other health worker that you have hypertension?</p> <p><i>-Record 99 if don't know/unsure</i></p>	<p>0 = No 1 = Yes</p>	Categorical binary	HT_sel f-report diagnosis	WHO STEPS
Q16	<p>Have you ever been told by a doctor or other health worker that you have diabetes?</p> <p><i>-Record 99 if don't know/unsure</i></p>	<p>0 = No 1 = Yes</p>	Categorical binary	DM_sel f-report diagnosis	WHO STEPS

Q17	Have you ever been told by a doctor or other health worker that you have heart problems? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical binary	Co-morbidity (CVD)	WHO STEPS
Q18	Have you ever been told by a doctor or other health worker that you have symptoms suggestive of a stroke? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical binary	Co-morbidity (CVD)	WHO STEPS
Q19	Have you ever been told by a doctor or other health worker that you have chronic kidney disease? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical binary	Co-morbidity (CKD)	WHO STEPS
Q20	How many natural teeth do you have? <i>-Record 99 if don't know</i>	0 = None 1 = 1-9 teeth 2 = 10-19 teeth 3 = 20 teeth or more	Categorical ordinal	Dental health	WHO Oral Health Questionnaire
Q21	During the past 12 months, did your teeth or mouth cause any pain or comfort? <i>-Record 99 if don't know</i>	0 = No 1 = Yes	Categorical binary	Dental health	WHO Oral Health Questionnaire
Q22	Over the last 2 weeks, how often have you been bothered by any of the following problems? Q 22.1. Little interest or pleasure in doing things [____] Q 22.2. Feeling down, depressed, or hopeless. [____] Q 22.3. Trouble falling or staying asleep, or sleeping too much. [____]	0 = Not at all 1 = Several days 2 = More than half the days 3 = Nearly everyday	Categorical ordinal	Mental health	PHQ-9

	<p>Q 22.4. Feeling tired or having little energy. [____]</p> <p>Q 22.5. Poor appetite or overeating [____]</p> <p>Q 22.6. Feeling bad about yourself – or that you are a failure or make yourself or down your family [____]</p> <p>Q 22.7. Trouble concentrating on things, such as reading the newspaper or watching television [____]</p> <p>Q 22.8. Moving or speaking so slowly that other people could have noticed? Or the opposite being so fidgety or restless that you have been moving around a lot more than usual [____]</p> <p>Q 22.9. Thoughts that you would be better off dead or of hurting yourself in some ways [____]</p>				
Q42	<p>We would like to confirm that:</p> <p><i>-This question is for categorizing respondents for the following sections and it is also important to ask respondents to confirm their main conditions in this survey.</i></p> <p><i>-IF the answer is “0”, go to Section 3</i></p> <p><i>-IF the answer is “1”, go to Section 3a</i></p> <p><i>-IF the answer is “2”, go to Section 3b</i></p> <p><i>-IF the answer is “3”, go to Section 3c</i></p>	<p>0 = Neither hypertension nor diabetes</p> <p>1 = Only hypertension</p> <p>2 = Only diabetes</p> <p>3 = Both diabetes and hypertension</p>			

SECTION 3: HEALTH CARE UTILIZATION

Q.N	Description and Questions	Response	Type of Variable	Field	Ref:
Q23	<p>Have you sought medical treatment or advice as an outpatient from anyone in the past 3 months?</p> <p><i>-If No, go to Question 40.</i></p>	<p>0 = No 1 = Yes</p>	Categorical variable	Medical advice	GACD book
Q24	<p>Where did you seek medical advice or treatment for illness in the past 3 months?</p> <p><i>-More than one answer can be selected.</i> <i>-Data collectors can use probes to help respondents determine the types of health facilities in the Response Column.</i> <i>-Record 99 if don't know and 88 if refuse</i></p>	<p>1= National hospital (PP) 2= Provincial hospital (RH) 3= District hospital (RH) 4= Health centre 5= Health post 6= Provincial rehabilitation centre (PRC) or Community-based rehabilitation (CBR) 7= Other public; specify: 8= Private hospital 9= Private clinic 10= Private pharmacy 11= Home/Office of trained health worker/nurse 12= Visit of trained health worker/nurse 13= Other private medical; specify: 14= Shop selling drugs/market 15= Kru Khmer/Magician</p>	Categorical Nominal	Care provider_3M	CDHS and GACD book

		16= Monk/religious leader 17= Traditional birth attendant 18= Oversee medical service 19= Other; specify:			
From Q25-Q39, it is a set of questions that are asked following choices selected in Q24. If 2 or 3 choices were selected in Q24, Q25-Q39 would appear 2 or 3 times, accordingly.					
Q25	How many times did you visit the selected place(s) in Q24 in the past three months?	_____ times	Quantitative discrete	Number of visits	GACD
Q26	How much in total was spent on the treatment at the selected place(s) in Q24? <i>-Record 99 if don't know and 88 if refuse</i>	0 = free/no cost 1 = in kind 2 = _____ Riels	-Categorical nominal - Quantitative Continuous	Cost of treatment	CDHS
Q27	How did you pay for the treatment cost at the selected place(s) in Q24? <i>-Record 99 if don't know and 88 if refuse</i>	1= Health Equity Fund 2= Voucher 3= Fee Exemption 4= NGO 5= National Social Security Fund 6= Community-Based Health Insurance 7= Health Insurance through Employer 8= Other Privately Purchased Commercial Health Insurance	-Categorical nominal	Payment method	GADC adapted to context specific

		9= Wage/income 10= Loan/ Ton Tin 11= Sale of Assets 12= Gift from Relative 13= Savings 14= Other			
Q28	How much in total was spent on transport to go to and return from the selected place(s) in Q24? <i>-Record 99 if don't know and 88 if refuse</i>	0 = free/no cost 1 = in kind 2 = _____ Riels	-Categorical nominal - Quantitative Continuous	Cost of transport	CDHS
Q29	On average how many hours do you spend to get treatment/advices from the selected place(s) in Q24? <i>-Record 99 if don't know and 88 if refuse</i>	_____ Hours	Quantitative continuous	Time spending	GACD book (Adapted)
Q30	How satisfied are you with the effect of your {treatment/care} at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q31	How satisfied are you with the explanations the {doctor/other health professional} has given you about the results of your {treatment/care} at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied	Categorical ordinal	Patient satisfaction of care services	SAPS 2006

1 2 3 4 5 6 7 8 9 10 11	Q32	The {doctor/other health professional} at the selected place(s) in Q24 was very careful to check everything when examining you. <i>-Record 99 if don't know/unsure</i>	0 = Strongly agree 1 = Agree 2 = Not sure 3 = Disagree 4 = Strongly disagree	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
12 13 14 15 16 17 18 19 20 21	Q33	At the selected place(s) in Q24, how satisfied were you with the choices you had in decisions affecting your health care? <i>-Record 99 if don't know/unsure</i>	0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
22 23 24 25 26 27 28 29 30 31 32 33	Q34	How much of the time did you feel respected by the {doctor/other health professional} at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = All of the time 1 = Most of the time 2 = About half the time 3 = Some of the time 4 = None of the time	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
34 35 36 37 38 39 40 41	Q35	At the selected place(s) in Q24, the time you had with the {doctor/other health professional} was too short. <i>-Record 99 if don't know/unsure</i>	0 = Strongly agree 1 = Agree 2 = Not sure 3 = Disagree 4 = Strongly disagree	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
42 43 44 45 46 47 48 49 50 51 52	Q36	Are you satisfied with the care you received in the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied	Categorical ordinal	Patient satisfaction of care services	SAPS 2006

1 2 3 4 5 6 7 8 9 10 11	Q37	Did you get your blood pressure measured at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical variable	Access to blood pressure testing	Opinion
12 13 14 15 16 17 18 19	Q38	Did you get your blood glucose tested at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical variable	Access to blood glucose testing	Opinion
20 21 22 23 24 25 26 27 28 29	Q39	Would you recommend the selected place(s) in Q24 to others? <i>-Record 99 if don't know/unsure</i>	1 = Not recommended 2 = Recommend with reservations 3 = Recommend 4 = Highly recommend	Categorical ordinal	Patient satisfaction of care services	Opinion
30 31 32 33 34 35 36 37	Q40	Have you ever had your blood glucose tested in the last three years? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical binary	Testing DM (CoC)	Opinion
38 39 40 41 42 43 44 45 46	Q41	Have you ever had your blood pressure measured in the last three years? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical binary	Testing HT (CoC)	Opinion
47 48 49 50 51 52 53 54 55 56 57						

SECTION 3a: HEALTH CARE UTILIZATION FOR HYPERTENSION

Q.N	Description and Questions	Response	Type of Variable	Field	Ref:
Q43a	<p>How long have you lived with hypertension?</p> <p><i>-Record 99 if don't know/unsure and 88 if refuse</i> <i>-Less than a year is rounded up to one year</i> <i>-Standard rounded up formula is applied.</i></p>	_____ Years	Quantitative concrete	Durati on HT	Opinion
Q44a	<p>Where were you first diagnosed as having hypertension?</p> <p><i>-Record 99 if don't know and 88 if refuse</i></p>	<p>1= National hospital (PP) 2= Provincial hospital (RH) 3= District hospital (RH) 4= Health centre 5= Health post 6= Provincial rehabilitation centre (PRC) or Community-based rehabilitation (CBR) 7= Other public; specify: 8= Private hospital 9= Private clinic 10= Private pharmacy 11= Home/Office of trained health worker/nurse 12= Visit of trained health worker/nurse 13= Other private medical; specify: 14= Shop selling drugs/market 15= Kru Khmer/Magician</p>	Categorical Nominal	Diagnosis HT (CoC)	Opinion

		<p>16= Monk/religious leader 17= Traditional birth attendant 18= Oversee medical service 19= MoPoTsyo 20= Other; specify:</p>

Q32	The {doctor/other health professional} at the selected place(s) in Q24 was very careful to check everything when examining you. <i>-Record 99 if don't know/unsure</i>	0 = Strongly agree 1 = Agree 2 = Not sure 3 = Disagree 4 = Strongly disagree	Categorical ordinal	Patient satisfaction of care services	SAPS 2006

Q33	At the selected place(s) in Q24, how satisfied were you with the choices you had in decisions affecting your health care? <i>-Record 99 if don't know/unsure</i>	0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q34	How much of the time did you feel respected by the {doctor/other health professional} at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = All of the time 1 = Most of the time 2 = About half the time 3 = Some of the time 4 = None of the time	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q35	At the selected place(s) in Q24, the time you had with the {doctor/other health professional} was too short. <i>-Record 99 if don't know/unsure</i>	0 = Strongly agree 1 = Agree 2 = Not sure 3 = Disagree 4 = Strongly disagree	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q36	Are you satisfied with the care you received in the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q37	Did you get your blood pressure measured at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical variable	Access to blood pressure testing	Opinion

1 2 3 4 5 6 7 8 9 10 11	Q38	Did you get your blood glucose tested at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical variable	Access to blood glucose testing	Opinion
12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60	Q39	Would you recommend the selected place(s) in Q24 to others? <i>-Record 99 if don't know/unsure</i>	1 = Not recommended 2 = Recommend with reservations 3 = Recommend 4 = Highly recommend	Categorical ordinal	Patient satisfaction of care services	Opinion

STROBE Statement—Checklist of items that should be included in reports of *cross-sectional studies*

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	1
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	2-3
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	5
Objectives	3	State specific objectives, including any prespecified hypotheses	7
Methods			
Study design	4	Present key elements of study design early in the paper	10
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	10-14
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants	12
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	13-14
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	10, 13, 14
Bias	9	Describe any efforts to address potential sources of bias	12
Study size	10	Explain how the study size was arrived at	12-13
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	15-16
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	15-16
		(b) Describe any methods used to examine subgroups and interactions	15-16
		(c) Explain how missing data were addressed	NA
		(d) If applicable, describe analytical methods taking account of sampling strategy	NA
		(e) Describe any sensitivity analyses	NA
Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	17
		(b) Give reasons for non-participation at each stage	17, 12, 13
		(c) Consider use of a flow diagram	13
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	17
		(b) Indicate number of participants with missing data for each variable of interest	17
Outcome data	15*	Report numbers of outcome events or summary measures	18-19, 22

1			
2	Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted
3			estimates and their precision (eg, 95% confidence interval). Make clear
4			which confounders were adjusted for and why they were included
5			
6			(b) Report category boundaries when continuous variables were
7			categorized
8			
9			(c) If relevant, consider translating estimates of relative risk into
10			absolute risk for a meaningful time period
11	Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions,
12			and sensitivity analyses
13			
14	Discussion		
15	Key results	18	Summarise key results with reference to study objectives
16	Limitations	19	Discuss limitations of the study, taking into account sources of potential
17			bias or imprecision. Discuss both direction and magnitude of any
18			potential bias
19			
20	Interpretation	20	Give a cautious overall interpretation of results considering objectives,
21			limitations, multiplicity of analyses, results from similar studies, and
22			other relevant evidence
23			
24	Generalisability	21	Discuss the generalisability (external validity) of the study results
25			
26	Other information		
27	Funding	22	Give the source of funding and the role of the funders for the present
28			study and, if applicable, for the original study on which the present
29			article is based
30			

31 *Give information separately for exposed and unexposed groups.

32
33
34 **Note:** An Explanation and Elaboration article discusses each checklist item and gives methodological background and
35 published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely
36 available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at
37 <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is
38 available at www.strobe-statement.org.

BMJ Open

Healthcare utilization and expenditure among people with type 2 diabetes and/or hypertension in Cambodia: results from a cross-sectional survey

Journal:	<i>BMJ Open</i>
Manuscript ID	bmjopen-2022-061959.R1
Article Type:	Original research
Date Submitted by the Author:	25-Aug-2022
Complete List of Authors:	Chhim, Srean; National Institute of Public Health, Technical Office Te, Vannarath; National Institute of Public Health, School of Public Health Buffel, Veerle; University of Antwerp, Sociology van Olmen, Josefiën; University of Antwerp, ELIZA Chham, Savina; National Institute of Public Health, Long, Sereyraksmey; National Institute of Public Health, School of Public Health Yem, Sokunthea; National Institute of Public Health, Technical Office Van Damme, Wim; Institute of Tropical Medicine, Public Health; Vrije Universiteit Brussel, Gerontology Wouters, Edwin; University of Antwerp, Centre for Longitudinal & Life Course Studies; University of the Free State, Centre for Health Systems Research & Development Por, Ir; National Institute of Public Health
Primary Subject Heading:	Public health
Secondary Subject Heading:	Health services research
Keywords:	HEALTH SERVICES ADMINISTRATION & MANAGEMENT, HEALTH ECONOMICS, Hypertension < CARDIOLOGY, General diabetes < DIABETES & ENDOCRINOLOGY, Organisation of health services < HEALTH SERVICES ADMINISTRATION & MANAGEMENT

ABSTRACT

Objective: To assess utilization of public and private healthcare, related healthcare expenditure, and associated factors for people with type 2 diabetes (T2D) and/or hypertension (HTN) and for people without those conditions in Cambodia.

Methods: A cross-sectional household survey.

Settings: Five operational districts in Cambodia.

Participants: Data was from 2,360 participants aged ≥ 40 years who had used healthcare services at least once in the three months preceding the survey.

Primary and secondary outcome: The main variables of interest were the number of healthcare visits and healthcare expenditure in the last three months.

Results: The majority of healthcare visits took place in the private sector. Only 22.0% of healthcare visits took place in public healthcare facilities: 21.7% in people with HTN, 37.2% in people with T2D, 34.7% in people with T2D plus HTN, and 18.9% in people without the two conditions (P -value <0.01). For people with T2D and/or HTN, increased public healthcare use was significantly associated with Health Equity Fund (HEF) membership and living in operational districts with *community-based care*. Furthermore, significant healthcare expenditure reduction was associated with HEF membership and using public healthcare facilities in these populations.

Conclusion: Overall public healthcare utilization was relatively low; however, it was higher in people with chronic conditions. HEF membership and *community-based care* contributed to higher public healthcare utilization among people with chronic conditions. Using public healthcare services, regardless of HEF status reduced healthcare expenditure, but the reduction in spending was more noticeable in people with HEF membership. To protect people with T2D

1
2
3 46 and/or HTN from financial risk and move towards the direction of universal health coverage, the
4
5 47 public healthcare system should further improve care quality and expand social health protection.
6
7
8 48 Future research should link healthcare use and expenditure across different healthcare models to
9
10 49 actual treatment outcomes to denote areas for further investment.

STRENGTHS AND LIMITATIONS OF THIS STUDY

- Our study is among the few to examine healthcare utilization and expenditure among people with type 2 diabetes (T2D) and/or hypertension (HTN) in comparison to people without these two conditions in Cambodia.
- The sampling design--randomizing villages, households, and household members--is robust within its scope, targeting the population in rural or semi-rural settings in Cambodia.
- The data collection is robust and ensures a reliable dataset.
- The fact that the five operational districts were selected purposively limited the generalizability for the national level as most of the study sites we selected were rural or semi-rural.
- The sample size for the group of people with T2D only and people with T2D plus HTN may be relatively small and may have insufficient power to assess the association between outcome variables and the dependent variables.

64 INTRODUCTION

65 Type 2 diabetes (T2D) and hypertension (HTN) are global public health concerns. They are major
66 risk factors for cardiovascular diseases, causing about 31% (17.9 million) of all deaths worldwide
67 annually.[1] The prevalence of people with T2D and/or HTN will likely continue to increase.[2]
68 These two diseases disproportionately affect low- and middle-income countries and account for
69 around 75% of all deaths in these countries.[1]

70 In Cambodia, large-scale population-based studies such as STEPS Surveys have shed light on the
71 prevalence and risk factors of chronic diseases. The prevalence of T2D and HTN rose noticeably
72 over recent years from 2.9% and 11.2% in the population aged 25–64 years in 2010 to 9.6% and
73 14.2% in the population aged 18–69 years in 2016, respectively.[3]

74 Previous nationally representative surveys have shown that a majority of the population seeks
75 outpatient curative care in private facilities, but knowledge on the related healthcare uptake and
76 expenditure among those with T2D and/or HTN is scarce.[4] Additionally, these surveys do not
77 cover topics related to the management of the diseases, such as healthcare utilization and
78 expenditure.[5] There is only one study, by Bigdeli *et al.*, which examines access to care for people
79 with T2D and/or HTN concerning social health protection schemes in Cambodia.[6] This study
80 shows that 61% of the people with T2D and/or HTN who knew their status were diagnosed in
81 private facilities.[6] However, this study collected data in 2013, before key interventions were
82 introduced or expanded in public healthcare facilities.[7] Also, it provides limited information
83 about which types of health facilities were used, and what differences exist between people with
84 one or both conditions compared to those without.

85 In the last decade, the Cambodian Ministry of Health (MoH), in collaboration with development
86 partners, made significant efforts to improve the quality of public healthcare and initiated a few

1
2
3 87 healthcare delivery models for people with T2D and/or HTN in public facilities.[7] These models
4
5 88 include *hospital-based care*, *health center-based care*, *community-based care* and a combination
6
7
8 89 of all three models (*coexisting care*) (Box 1). These efforts might have changed the pattern of
9
10 90 healthcare utilization and related expenditure, especially among people with T2D and/or HTN.
11
12
13 91
14
15 92

Box 1. Overview of different care models in Cambodia in 2021

- The *hospital-based care* model is standard care, which means an operational district (OD) has a government-run Non-communicable Disease (NCD) clinic at the district referral hospitals.[7] By 2021, 31 out of 117 referral hospitals had implemented this model. the patients refer themselves to the units (and they are thus not transferred by an intermediary unit).
- The *health center-based care* model adopts the World Health Organization Package of Essential Non-communicable Disease Interventions (WHO PEN).[7] In this model, the MoH added the function of a health center to *hospital-based care*. However, the coverage of health centers with the WHO PEN varies in each OD, which can be divided into low coverage (<50% of all health centers implement the WHO PEN; *health center-based care (low)*) and high coverage (\geq 50% of all health centers implement the WHO PEN; *health center-based care (high)*). The referral flow is slightly different between T2D and HTN. For T2D, this model identifies cases in the health centers through a screening test. If the patients are suspected of having T2D, health centers refer them to a diabetes clinic at a district referral hospital for confirmation of diagnosis. Once diagnosed, severe cases are treated in the hospital clinic, and stable or mild cases are followed up regularly at the health centers. For HTN, the health centers treat mild

patients and refer the severe cases to the referral hospital. By 2021, *health center-based care* was implemented in 137 of 1,221 health centers.

- The *community-based care* model or peer education network established and run by MoPoTsyo, a local non-governmental organization.[7] In this model, peer educators (PEs) are added to hospital-based care. MoPoTsyo trained people with T2D and/or HTN to be PEs. These PEs play a role in screening and referring those suspected of having T2D and/or HTN to seek medical consultation and treatment at the referral hospitals that MoPoTsyo has partnered with. The PEs also provide counseling on lifestyle changes and support self-management to registered network members. By 2019, this *community-based care* model had been implemented in 20 of 102 ODs in 8 of 25 provinces in Cambodia.[7 8] It had 225 PEs to serve 40,000 people with T2D.[8]
- The *coexisting care* model comprises a combination of the above three models. At the time of the study until 2021, only one OD (Daunkeo) had this model.

93
94 A better understanding of the current patterns of healthcare utilization and expenditure among
95 people with T2D and/or HTN is critical for better resource allocations and strategies to improve
96 the management of T2D and HTN. The main objectives of this study are two-fold. First, it
97 evaluates usage and determines the factors associated with public healthcare use in four groups:
98 (1) people without T2D or HTN, (2) people with T2D alone, (3) people with HTN alone, and (4)
99 people with T2D plus HTN. Second, it assesses the healthcare expenditure in the three months
100 preceding the survey for all services used by the four patient groups in public and private
101 facilities and determines factors associated with (reducing or increasing) healthcare expenditure.

Context

The health system in Cambodia is pluralistic, meaning healthcare services are provided by both public and private healthcare providers.[4 9]

Public healthcare services in Cambodia dominate preventive services (reproductive, maternal, neonatal, and child health), control of primary disease (tuberculosis, malaria, and HIV/AIDS control), and inpatient treatment.[4] The facilities include health posts, health centers, district referral hospitals, provincial referral hospitals, and national hospitals.[4] Public healthcare is organized per operational district (OD)—the third and last administrative level in Cambodia's health system management.[4] An OD covers a population of 100,000–200,000 people while a health center covers a population of 10,000–20,000 people.[4] Remote areas with a small population can be covered by a health post.[4] The health post provides similar services to a health center, but it is smaller than a health center.[4] Each OD usually has one district referral hospital with a few ODs having two district hospitals.[4] The district referral hospital receives self-referred patients or those referred by the health centers.

Alongside this public sector, a large *private healthcare sector* exists, which is more accessible than the public sector, and dominates outpatient curative care.[4] Since 1994, the Cambodian government started economic liberalization, permitting staff to work outside their government's working hours and own healthcare facilities.[4] Since then, the private healthcare sector and dual practice system, meaning public healthcare workers also have private practices, have grown rapidly. In 2015, over 50% of the healthcare workforce in private healthcare facilities were government personnel.[4] The private healthcare facilities range from cabinets, laboratories, pharmacies, clinics, and polyclinics to hospitals.[4] Cabinets are the smallest facilities with less than two beds and mainly provide medical consultation services.[10 11] According to the MoH

1
2
3 125 Progress Report in 2018, over 90% of private healthcare facilities were cabinets.[10 11] The
4
5 126 second most frequent facilities were clinics (3.2%), providing medical specialties, laboratories,
6
7 127 radiology services, and pharmacies.[10] A clinic has between 10 and 20 beds.[10] In addition,
8
9 128 buying medication in pharmacies or drugstores for self-treatment without a doctor's prescription
10
11 129 is common in Cambodia, although not permitted by law.[12]
12
13
14 130 In terms of health expenditure, the public healthcare sector did not charge user fees until 1996.[4]
15
16 131 In that year, the government introduced a user-fee scheme for the public sector with fees approved
17
18 132 by the local community to increase healthcare quality at public healthcare facilities.[4 13] The
19
20 133 revenue from the user-fee scheme could be used to incentivize staff and support ongoing
21
22 134 operations. However, the user-fee posed challenges for the poor to access public healthcare. To
23
24 135 address this, the MoH established the Health Equity Fund (HEF) in 2000, a pro-poor social health
25
26 136 protection scheme.[14] The HEF is linked to the implementation of identification of the poor
27
28 137 (known as "IDPoor").[15] It is intended for the "extremely poor" or "poor" category, which is
29
30 138 assessed and verified by the local authorities.[15] People with IDPoor are entitled to HEF support,
31
32 139 meaning that they receive free healthcare services at public healthcare facilities and transportation
33
34 140 expenditure reimbursement.[15] By 2019, the HEF covered approximately three million or about
35
36 141 20% of Cambodia's population.[14] Another scheme is the National Social Security Fund (NSSF),
37
38 142 established in 2007.[16] The NSSF covers work and non-work-related illnesses and injuries for
39
40 143 formally employed people.[16] Formal employers are mandated to pay for their staff's NSSF
41
42 144 membership. The NSSF had enrolled over 1.7 million employees or about 11% of the population
43
44 145 by 2019.[17]
45
46
47 146 However, it is important to note that several studies have indicated that the private sector still
48
49 147 constitutes a significant source for out-of-pocket expenditure (OOPE).[18 19] Between 2009 and

148 2016, around 60% of health expenditure was OOPE while the rest was a combination of the
149 government's and development partners' budgets. The OOPE per capita increased slightly from
150 USD 40.6 in 2009 to USD 48.1 in 2016.[19] In 2016, 76.6% of the total OOPE was linked to
151 private healthcare.[18 19]

152

153

For peer review only

154 METHODS

155 Data sources

156 This study is part of a larger cross-sectional household survey, with the primary aim of
157 developing a care cascade for T2D and HTN.

159 Settings

160 The study purposively selected five ODs. The selection was made to include different T2D
161 and/or HTN care models piloted in Cambodia: *coexisting care*, *community-based care*, *health-*
162 *center based care (high)*, *health-center based care (low)*, and *hospital-based care* (Box 1).

163 The five ODs in which the study took place are out of 103 ODs in the country and located in five
164 different provinces. The map of ODs is presented in Annexure 1. These ODs have similar road
165 infrastructure improvements, in which poor road conditions are no longer a barrier to accessing
166 healthcare.

- 167 ▪ *OD Daunkeo, Takeo province*: This OD had the “*coexisting care*” model. At the time of
168 the study, it was the only OD in which the three care models coexisted. The catchment
169 area included Takeo town and a large rural area. Its NCD clinic was established in 2002,
170 and the peer educator network was initiated in 2007 and handed over to the MoH in
171 2015.[20] The WHO PEN was implemented in 5 out of 14 health centers since 2015. The
172 private services for people with T2D and/or HTN may also be easily accessible.
- 173 ▪ *OD Kong Pisey, Kampong Speu province*: This OD had the “*community-based care*”
174 model. It has a strong MoPoTsyo network to provide T2D and HTN care to patients.
175 Located about 54 kilometers from the capital of Phnom Penh, this OD is semi-urban with
176 a variety of private facilities.

- 1
2
3 177 ▪ *OD Pearaing, Prey Veng province:* This OD had the “*health center-based (high)*” model,
4
5 178 and was the OD with high coverage of the WHO PEN. Six out of nine health centers in
6
7 179 this OD have been piloting the WHO PEN since 2015. Due to dual practice, the high
8
9 180 coverage of the WHO PEN also facilitates accessible private services for people with
10
11 181 T2D and/or HTN.
- 12
13
14 182 ▪ *OD Sot Nikum, Siem Reap province:* This OD had the “*health center-based (low)*”
15
16 183 model, and was the OD with low coverage of the WHO PEN (6/25 of the health centers
17
18 184 started the WHO PEN in 2018). This OD has been historically and significantly
19
20 185 influenced by the financial support of various development partners, and services for
21
22 186 people with T2D and/or HTN have been well arranged at its NCD clinic.[21]
23
24
25 187 ▪ *OD Samrong, Oddar Meanchey province:* This OD had a “*hospital-based care*” model. It
26
27 188 had an NCD clinic without the WHO PEN and peer educator network. A large part of the
28
29 189 catchment area is a remote area bordering Thailand, approximately 470 kilometers from
30
31 190 the capital. Therefore, the private services for people with T2D and/or HTN may not be
32
33 191 broadly accessible.
34
35
36
37
38
39

40 193 **Samples**

41
42 194 The larger household survey recruited 5,072 individuals aged 40 years or older to participate in
43
44 195 the study using a multi-stage cluster sampling method. Initially, it purposively chose five ODs
45
46 196 with different care models for T2D and HTN. Second, 44 villages per OD were randomly
47
48 197 selected, regardless of the population size of each OD. The purpose of this equal probability
49
50 198 selection was to over-sample participants in ODs with a smaller population so that they would
51
52 199 have an adequate sample for each care model. Third, 24 households in each village were selected
53
54
55
56
57
58
59
60

1
2
3 200 by probability systematic sampling, and finally, one person aged 40 years or older per household
4
5 201 was selected at random. To minimize the non-response rate, which can unintentionally exclude a
6
7 202 certain group of the target population from the survey, the selected participants were called back
8
9
10 203 or followed-up three times when they were absent from their household. If the attempt failed,
11
12 204 another household in the next row in the sampling list was selected. Then, the procedure
13
14 205 described above was repeated. The equal probability selection at the village and household levels
15
16 206 were used with the OD level's same purpose.

17
18
19 207 To correspond to our analytical objective, we used a subset of this sample: we only retained
20
21 208 those who reported using healthcare services at least once in the three months preceding the
22
23 209 survey (Figure 1). A total of 2,360/5,072 participants met this criterion. The 2,360-participant
24
25 210 sample subset included four patient groups: 1,331 people without T2D and HTN, 761 people
26
27 211 with HTN alone, 109 people with T2D alone, and 159 people with T2D plus HTN.
28
29
30
31 212

1
2
3 213
4 214 **Data collection**
5

6 215 The data collection took place between July and October 2020. The data collection was
7
8
9 216 conducted in three steps following the WHO's STEPS Survey approach: (1) interviews with a
10
11 217 structured questionnaire, (2) anthropometric measurements, and (3) biochemical
12
13 218 measurements.[5] Since our study only focuses on healthcare utilization and expenditure, we
14
15
16 219 only used information from step 1—interviews with a structured questionnaire. The
17
18 220 questionnaire was tablet-based and comprised of 11 sections, including socio-demographic
19
20 221 information, health status and quality of life, healthcare utilization, social support, lifestyle or
21
22 222 behavior measures, physical activity, diabetes and hypertension knowledge, medication
23
24
25 223 adherence, self-management support, and decision-making power on food. However, we only
26
27 224 used two sections in our analysis: socio-demographic information and healthcare utilization.
28
29 225 The tablet-based questionnaire was installed using the Kobo Toolbox
30
31
32 226 (<https://kf.kobotoolbox.org>), an open-source software with a free-of-charge server and online
33
34 227 storage.[22]
35

36 228 **Measures**
37

38
39 229 This study's primary variable of interest is the number of visits to public and private facilities.
40
41 230 By public healthcare facilities, we refer to government-run facilities that provide medical
42
43 231 services, and include national hospitals, provincial referral hospitals, district referral hospitals,
44
45 232 health centers, and health posts. A health post is similar to a health center, and only a few exist in
46
47
48 233 remote areas. Therefore, we grouped them with health centers. Private healthcare services are
49
50 234 non-government organizations that provide medical and non-medical services, and include
51
52 235 private hospitals, private clinics, pharmacies, homes of trained health workers, and visits of
53
54
55
56
57
58
59
60

236 health workers to the patients' homes. Traditional healing/medicine and using healthcare services
237 abroad have also been included in this category.

238 The secondary variable of interest was healthcare expenditure, the lump sum expenditure of
239 medical consultation, treatment, and medication. These data were obtained from the interview
240 with the participants. They were asked about their use of health services in the three months
241 preceding the survey (where they went, how often they went to a particular type of healthcare
242 facility, and how much they spent in each facility in those three months). We include the
243 questionnaire in Annexure 2. The Cambodian currency (riels) was converted into USD at an
244 exchange rate of 4,000 riels per USD. The expenditure does not include other spendings such as
245 on transport, food, or guesthouses/hotels.

246 To better understand the profile of people using public or private healthcare facilities, we
247 estimated associations between the use of public and private healthcare services and patient
248 characteristics such as sex (male, female), age (40–49, 50–59, 60+ years old), educational level
249 (none, primary, secondary or higher), social protection status (NSSF (yes, no), HEF (yes, no)),
250 wealth quintile (poorest, poor, medium, rich, richest), type of care models (*hospital-based, health
251 center-based (high), health center-based (low), and community-based*). The details on wealth
252 quintile calculation (socio-economic class) are described in Annexure 3.

253

254 **Analysis**

255 Healthcare utilization

256 Taking the number of visits as a dependent variable, we report the healthcare visit rate to public
257 and private facilities over the three months preceding the survey, then stratified by patient
258 groups.

1
2
3 259 To identify the independent factors associated with healthcare utilization (defined by the number
4
5 260 of visits), we first used bivariate negative binomial regression to identify the potential factors in
6
7 261 the five groups—overall and four patient groups—separately. Variables with a P -value <0.25 in
8
9 262 at least one of the four patient groups or overall group were included in the multiple negative
10
11 263 binomial regression. The exposure variable (total healthcare visits of each participant) was
12
13 264 incorporated into this model. Variables with a P -value <0.05 were considered statistically
14
15 265 significant in this final model. The negative binomial regression was chosen over Poisson
16
17 266 regression because the number of visits was over-dispersed.
18
19
20
21
22 267

23 268 Healthcare expenditure

24
25
26 269 We took healthcare expenditure in the three months preceding the survey as the dependent
27
28 270 variable. Due to the limitation of our data, we focused more on assessing the factors associated
29
30 271 with healthcare expenditure and did not explore the overall medical expenditure. We reported the
31
32 272 overall arithmetic mean and then stratified the mean by patient groups. The expenditure was
33
34 273 calculated separately for each patient group. Because arithmetic means can be easily affected by
35
36 274 extremely high values, we removed the values above the 90th percentile, which we believe were
37
38 275 too high in our sample.
39

40
41
42 276 Our analysis was carried out in three steps to separately identify the independent factors
43
44 277 associated with healthcare expenditure in the four patient groups. First, a logarithmic
45
46 278 transformation of the healthcare expenditure was performed as the data was skewed to the right.
47
48 279 Second, in the bivariate analysis, we compared the geometric mean of healthcare expenditure by
49
50 280 characteristics of the participants. This analysis identified the variables potentially associated
51
52 281 with the healthcare expenditure at a P -value <0.25 . During this phase, the Student's t -test for
53
54
55
56
57
58
59

1
2
3 282 binary explanatory variables and the one-way ANOVA test for non-binary explanatory variables
4
5 283 were used. Variables with a significant level at a P -value <0.25 in any patient group were
6
7
8 284 included in the multiple linear regression. Third, multiple linear regression was performed and
9
10 285 the coefficient and 95% confidence interval (CI) values were exponentiated to a risk ratio (RR)
11
12 286 for better interpretation.
13
14 287 Data were analyzed using Stata 16.0 (Stata Corp LLC, College Station, Texas 77, USA), and R
15
16
17 288 programing's GGLOT2 package was used to produce the graphs.
18
19
20

289

290 **Ethical approval**

291 The protocol was approved by the National Ethics Committee for Human Research (NECHR) on
292 April 29, 2019 (No. 105 NECHR) and by the Institutional Review Board of Institute of Tropical
293 Medicine (Antwerp) on October 25, 2019 (No. 1,323/19). All participants provided their consent
294 and volunteered to take part in the study.
295

296

296 **Patient and public involvement**

297 No patient was involved in the development of the research question and outcome measures,
298 study design, and study participant recruitment. The findings are not disseminated to the study
299 participants.
300

300

301 **RESULTS**

302 **Characteristics of participants**

303 Our analysis included 2,360 participants, including 1,331 people without T2D or HTN, 761
304 people with HTN alone, 109 with T2D alone, and 159 with T2D plus HTN (Table 1). The other
305
306
307
308
309
310

305 participants were excluded because they had not used healthcare services in the three months
 306 preceding the survey (N=2,703) or had a missing response to the primary variable of interest
 307 (N=9).

308 As shown in Table 1, females were more prevalent in all patient groups, especially in the T2D
 309 plus HTN group. The age range was between 40 and 96 years, with people with HTN and T2D
 310 plus HTN having a significantly higher average age than those without the two conditions. The
 311 majority of participants did not attend school or attended only primary school.

312 Regarding the social health protection scheme, a small proportion of participants in all groups
 313 had the NSSF membership (4.8% overall). A larger proportion of patients across all groups had
 314 the HEF membership (18.4% overall).

 319 *PEN; Health center-based (low) means the OD with low coverage (six out of 25) of health centers with the WHO*
 320 *PEN*

322 **Public and private healthcare utilization**

323 The 2,360 individuals reported 6,645 visits to the healthcare facilities in the three months
 324 preceding the survey, averaging 2.8 visits per person over three months.

325 Figure 2 presents the proportion of visits to public and private healthcare facilities. At the facility
 326 level, as shown in Figure 2A, the largest share was accounted for by private clinics (28.5%),
 327 followed by visits to the private homes of nurses or doctors (15.6%), private pharmacies
 328 (15.3%), health centers (12.6%), and private hospitals (11.6%).

329 The common public healthcare facilities used by participants with T2D and T2D plus HTN were
 330 provincial/national and district referral hospitals (Figure 2A). Approximately 29.7% of visits
 331 from people with T2D and 29.6% from people with T2D plus HTN went to provincial/national
 332 and district hospitals (Figure 2A). These proportions were higher than 6.9% for people without
 333 T2D or HTN and 6.1% for HTN only.

334 Overall, the private sector occupied about 78.0% of the total visits, and the public sector
 335 occupied 22.0% (Figure 2B). All groups visited private healthcare facilities more frequently than
 336 public healthcare facilities (Figure 2). However, the frequency of visiting public facilities was
 337 statistically higher in people with T2D and T2D plus HTN. As shown in Figure 2B, 37.2% of
 338 visits from people with T2D and 34.7% of visits from people with T2D plus HTN were to public
 339 healthcare facilities, compared with 18.9% of visits from people without the two conditions and
 340 21.7% of the visits from people with HTN (P -value<0.001).

341

342 **Public healthcare utilization by participant characteristics**

343 Table 2 compares the public healthcare facility user rates defined as the proportion of public
 344 healthcare visits over total visits (public visits plus private visits). The user rates were
 345 disaggregated by participant characteristics. In this bivariate analysis, age, NSSF, HEF, wealth
 346 quintile, and care model were significantly associated with public healthcare utilization at a *P*-
 347 value<0.25 in at least one patient group. Therefore, we included these variables in the multiple
 348 negative binomial regressions.

349

Abbreviation: NSSF, National Social Security Fund; HEF, Health Equity Fund

Note:

- The % of private healthcare is not presented in this table but can it be calculated by subtracting the % of the public healthcare from 100%.
- Health center-based (high) means the OD with high coverage (six out of nine) of health centers with the WHO PEN; Health center-based (low) means the OD with low coverage (six out of 25) of health centers with the WHO PEN
- "N" denotes the total of visits.
- *P*-values < 0.25 are in bold, indicating a significant level at 0.25. Variables with *P*-value < 0.25 were included in multivariate analysis.

Table 3 presents the results of the multiple negative binomial regressions. Overall, the significant increase in public healthcare use was associated with having T2D and T2D plus HTN, living in the OD with *coexisting care*, and HEF membership.

In people without T2D or HTN, HEF membership was significantly associated with public healthcare use: adjusted incidence rate ratio (AIRR) of 1.4 [95% CI 1.0–2.0], *P*-value < 0.05). We did not observe the same association in the other three groups.

In people with HTN, the poorest category was significantly associated with increasing public healthcare use with an AIRR of 2.1 [95% CI 1.1–4.0], *P*-value = 0.02), compared to those in the richest category. Nevertheless, the same association was not seen in other patient groups.

Regarding the care model, in people with T2D, the OD with *community-based care* (AIRR 3.7 [95% CI 1.2–11.3], *P*-value = 0.019) and the OD with low coverage of *health center-based care* (AIRR 3.3 [95% CI 1.1–9.8], *P*-value = 0.036) were significantly higher in public healthcare use than in the OD with *hospital-based care*.

375 In people with T2D plus HTN, the OD with *coexisting care* was associated with higher public
 376 healthcare use (AIRR 4.0 [95% CI 1.2–12.9], *P*-value=0.020).

385

386

387 **Healthcare expenditure**

388 Medical cost per year, overall and by facility

389 Overall, those who used healthcare spent an average of USD 25.3 [95% CI 22.9–27.6] for all
390 healthcare services in the three months preceding the survey (Figure 3).

391 When comparing patient groups, people with T2D plus HTN had the highest healthcare
392 expenditure with an average of USD 43.6 [95% CI 29.7–57.2], followed by people with T2D
393 with an average of USD 34.0 [95% CI 25.5–42.6]. These expenditures were statistically higher
394 than the average of USD 17.1 [95% CI 13.1–21.1] in people with HTN and the average of USD
395 26.9 [95% CI 23.9–29.9] in people without the two conditions with a P -value<0.001.

396 Table S1 shows the arithmetic mean of healthcare expenditure (Annexure 4). The arithmetic
397 mean is the mean before the data log-transformation. Since our model's Risk Ratio (RR) in Table
398 4 is the geometric mean (after log-transformation) ratio, we presented the geometric mean in
399 Table S2 (Annexure 4). In the bivariate analysis, sex, age, NSSF, HEF, wealth quintile, sector
400 (public vs. private), and care model were statistically associated with healthcare expenditure in
401 one or more patient groups with a P -value<0.25. These variables were included in the multiple
402 linear regression.

403 Table 4 presents results from the multiple linear regression analyses. Overall, having T2D or
404 T2D plus HTN, being female, having reported using both private and public healthcare, and
405 living in the OD with *community-based care* was significantly associated with increased
406 healthcare expenditure. In contrast, holding HEF membership and using public healthcare was
407 significantly associated with healthcare expenditure reduction.

408 At the group level, in people without the two conditions, HEF membership was significantly
409 associated with a reduction in healthcare expenditure with an adjusted risk ratio (ARR) of 0.7

410 [95% CI 0.5–0.8], P -value<0.001). The same association was seen in people with HTN (ARR of
 411 0.8 [95% CI 0.6–1.0], P -value<0.01), and in T2D plus HTN (ARR of 0.3 [95% CI 0.2–0.6], P -
 412 value<0.001). However, the association was not observed in people with T2D.

413 In people without the two conditions, using public healthcare was significantly associated with a
 414 reduction in the expenditure (ARR of 0.3 [95% CI 0.2–0.3], P -value<0.001). The association
 415 was also found in people with HTN (ARR 0.4 [95% CI 0.3–0.5], P -value<0.001).

416 People with T2D plus HTN who resided in the OD with *community-based care* were
 417 significantly associated with a higher expenditure with an ARR of 2.0 [95% CI 1.1–3.8], P -
 418 value<0.01) than those with *hospital-based care*.

Abbreviation: ARR, adjusted risk ratio; CI: confidence interval; Ref., reference group; OD, operational district
 Note: Health center-based (high) means the OD with high coverage (six out of nine) of health centers with the WHO PEN; Health center-based (low) means the OD with low coverage (six out of 25) of health centers with the WHO PEN; P -values<0.05, <0.01, <0.001 are in bold, indicating the variables are significantly associated with expenditure

DISCUSSION

The results show that the use of the public healthcare system remains low for all groups in our study, with about one in every five healthcare visits taking place in the public sector overall. People with chronic conditions, HEF membership, living in the OD with *community-based care* contributed to public healthcare uptake. The healthcare expenditure was significantly reduced when patients used public healthcare services, regardless of HEF membership. However, the reduction in spending was more noticeable in people with HEF membership. In contrast, expenditure was higher among patients living in the OD with *community-based care*. People in Cambodia predominantly used healthcare in private facilities for outpatient curative care.[19] Our study showed that this is also the case for people with chronic conditions such as

1
2
3 440 T2D and HTN, although this group had a slightly higher rate of using public healthcare services.
4
5 441 This result is congruent with earlier findings that approximately 61% of T2D and/or HTN
6
7 442 patients received their initial diagnosis in private settings.[6] A qualitative study in Cambodia
8
9 443 suggested that people with T2D did not prefer diabetes services at public facilities because they
10
11 444 were less accessible due to geographical factors or distance and limited medication supply.[23]
12
13 445 Comparing our findings to other low- and middle-income countries is challenging due to
14
15 446 differences in health system organization, government investment in health, and most studies
16
17 447 focusing on general services rather than T2D and/or HTN services. Nevertheless, our findings
18
19 448 are comparable to those from India, Nigeria, and Nepal, where government accounts for a very
20
21 449 small share (<30%) of national health expenditure as well. [24] In India, 75% of outpatient visits
22
23 450 were occupied by the private sector, similar to Nigeria (82%) and Nepal (65%).[24] Cambodia
24
25 451 and these three countries shared similar characteristics as the majority of the population relies on
26
27 452 low-cost, and low-quality private services. Our findings clearly suggest that healthcare quality
28
29 453 and access to public healthcare services is still below the expectations of people and the private
30
31 454 providers have a role in filling the gaps. To move forward in the direction of universal health
32
33 455 coverage, meaning that people can access the health services they need without financial
34
35 456 hardship, Cambodia should focus on expanding quality service coverage for people with T2D
36
37 457 and/or HTN at public healthcare facilities across the country. Expanding quality services at
38
39 458 public healthcare facilities may be the best suited approach to the Cambodian context, where
40
41 459 dual practice is strong and regulation weak. The literature suggests that the public and private
42
43 460 providers are not mutually exclusive and they shape each other's characteristics or sometimes so-
44
45 461 called competition for health benefits.[24 25] If public healthcare providers can provide quality
46
47 462 services at affordable prices to the poor or those from low-income households, visits to private
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 463 healthcare providers, who offer inferior services at higher prices, will decrease . [24 25] The
4
5 464 private healthcare providers will change their service provision to target the rich. [24 25]
6
7
8 465 Previous studies revealed that HEF membership contributed to the health service uptake at public
9
10 466 facilities and reduced healthcare expenditure in general users.[14 26] Our findings extended the
11
12 467 understanding that HEF membership has also increased public healthcare use and substantially
13
14 468 reduced healthcare spending among people with T2D and/or HTN. Since HEF benefits are only
15
16 469 available in public healthcare facilities, it is not surprising that it also contributes to increasing
17
18 470 service uptake in public facilities. The HEF is an important pillar of the Cambodian
19
20 471 government's social security system and our findings suggest that HEF membership should be
21
22 472 expanded to cover among people with chronic conditions. The Cambodian government
23
24 473 recognized that the current social protection system has not yet covered those so-called “missing
25
26 474 middle” between the poor, who are covered by the HEF, and those in formal employment, who
27
28 475 are covered by the NSSF. Therefore, a new social health protection scheme targeting those in the
29
30 476 informal economy and senior population without pensions, which accounts for 90% of people
31
32 477 aged 60 years or older in Cambodia, should be created. This social protection scheme must go
33
34 478 alongside with improving service coverage and quality. The success of such a model has been
35
36 479 demonstrated by Thailand, a neighboring country of Cambodia.[27 28] Thailand focused on
37
38 480 improving public healthcare services and introduced three public health insurance schemes. One
39
40 481 of them was the Universal Coverage Scheme, which covered 75% of the Thai population.[27]
41
42 482 Such a model might be too ambitious for Cambodia, since Thailand is more economically
43
44 483 developed than Cambodia. However, this is still a model that Cambodia should be aiming for, so
45
46 484 that quality health services for people with T2D and/or HTN will be more accessible.
47

51
52
53
54
55
56
57
58
59

1
2
3 485 *Community-based care* contributed to the higher public service uptake among T2D and/or HTN,
4
5 486 but it also contributed to the higher expenditure for the users. In ODs with this model, PEs refer
6
7 487 patients to the public referral hospitals, so it is not surprising that the public service uptake is
8
9 488 slightly higher than other ODs.[29] However, it is somewhat surprising that people with T2D
10
11 489 and/or HTN in the OD with *community-based care* spent more on their health services. It is
12
13 490 unclear what the influencing factors are because a large proportion of service users (80%) used
14
15 491 private services in this OD. Although, this may be partially explained by higher unit costs spent
16
17 492 by the supply side in *community-based care* to operate their services, so the patients are charged
18
19 493 a higher fee than other models. Our team had conducted a costing study in 2020 to examine the
20
21 494 costs to operate services by different care models. The study found that the annual unit costs
22
23 495 were higher for T2D and HTN patients in the *community-based care* than the *hospital-based*
24
25 496 *care* (USD 101 vs. USD 77 for a T2D patient and USD 83 vs. USD 55 for an HTN patient). The
26
27 497 higher unit costs in the *community-based care* were driven by adding PE components and field
28
29 498 activities to the model while drugs and consultation fee are not subsidized. The investment in
30
31 499 *community-based care* leads to better treatment outcomes, but it is not explored in our study. A
32
33 500 previous study provided limited information that a significant proportion of patients in the
34
35 501 *community-based care* network had achieved fasting blood glucose goals of 126 mg/dl, from
36
37 502 10% to 45%, and blood pressure goals of 140/90 mm Hg, from 58% to 67%, after a 12-month
38
39 503 follow-up.[20] This study, however, did not have a control group (patients outside the network).
40
41 504 From this, we can learn two things. First, the adapting and scaling up of PEs should be done with
42
43 505 a careful budget plan as PEs incur operational costs. Second, a study investigating the treatment
44
45 506 outcomes and cost-effectiveness between different care models should be conducted in order to
46
47
48
49
50
51

57
58
59

1
2
3 507 inform decision-making. We, therefore, cannot make a recommendation from this limited
4
5 508 finding.

6
7
8 509 There are several strengths in our study. First, our study is among the few to examine healthcare
9
10 510 utilization and expenditure both among people with T2D and/or HTN and people without the two
11
12 511 conditions in Cambodia. It furthermore covers both the public and private sectors. This broad
13
14 512 scope renders the results useful to inform T2D and HTN interventions in Cambodia. Second,
15
16 513 we covered a wide range of ODs which are geographically diverse and comprising of different
17
18 514 care models, which means that our participants are heterogeneous. The sampling design--
19
20 515 randomizing villages, households, and household members--is robust within its scope, targeting
21
22 516 the population in rural or semi-rural settings in Cambodia. Third, the data collection was robust
23
24 517 and ensured a reliable data set.

25
26
27
28 518 Our study also had its limitations. First, it may not represent the national level as most of the
29
30 519 study sites (villages) we selected were rural or semi-rural, which may lead to overestimating the
31
32 520 healthcare utilization in public facilities. Second, the ODs were purposively selected with
33
34 521 oversampling the OD with interventions, increasing the service uptake in public facilities. This
35
36 522 may lead to overestimating the public healthcare use in our study. Third, we only calculated the
37
38 523 healthcare expenditure for those who used the service in the three months preceding the survey,
39
40 524 which cannot be generalized outside this period. However, it is unlikely to be significant because
41
42 525 we focused more on factors associated with increasing or reducing healthcare expenditure.
43
44
45
46 526 Fourth, the sample size for people with T2D only and people with T2D plus HTN may be
47
48 527 relatively small. Therefore, variables that were not significantly associated with the dependent
49
50 528 variables in these groups in our study may be due to the insufficient sample size.

2
3 529
45 530 **CONCLUSION**

6
7
8 531 Healthcare utilization at public healthcare facilities is relatively low for all groups; however, it is
9
10 532 higher in people with chronic conditions. HEF membership and *community-based care*
11
12 533 contributed the higher public healthcare utilization in people with chronic conditions. Using
13
14 534 public healthcare services, regardless of HEF status, reduced the healthcare expenditure.
15
16
17 535 However, the reduction in spending was more noticeable in people with HEF membership. To
18
19 536 protect people with T2D and/or HTN from financial risk and move in the direction of universal
20
21 537 health coverage, the public healthcare system should further improve care quality, and expand
22
23
24 538 social health protection. Future research should link healthcare use and expenditure across
25
26 539 different healthcare models to actual treatment outcomes to denote areas for further investment.

541 ACKNOWLEDGMENTS

542 We would like to thank all the participants in the study and all data collectors for carefully
543 following the instructions.

544 AUTHOR CONTRIBUTIONS

545 SC, PI, VT, EW designed the study; SC analyzed data; SC, VT, VB, JO, SaC, SL, SY, WD, EW,
546 PI wrote the manuscript.

547 FUNDING

548 This work was funded by the Belgian Government through the VLIR-UOS project (no
549 award/grant number), the Fourth Funding Agreement (FA4) Programme (2017–2021) between
550 the Belgian Directorate of Development Cooperation and the Institute of Tropical Medicine,
551 Antwerp (no award/grant number), and the Horizon2020 Framework Program of the European
552 Union, grant no 825432.

553 CONFLICT OF INTERESTS

554 All authors declare no conflict of interest.

555 ETHICS APPROVAL

556 The protocol was approved by the National Ethics Committee for Human Research (NECHR) on
557 April 29, 2019 (No. 105 NECHR) and by the Institutional Review Board of Institute of Tropical
558 Medicine (Antwerp) on October 25, 2019 (No. 1,323/19). All participants provided their consent
559 and volunteered to take part in the study.

560 DATA AVAILABILITY STATEMENT

561 Data are available on reasonable request. Data are available on reasonable request to Dr. Por Ir
562 (ipor@niph.org.kh).

Annexure 1. Locations of the five studied ODs in Cambodia, 2020.

Annexure 2. Principal Component Analysis

The wealth quintile was used to classify participants into five socio-economic classes: poorest, poor, medium, rich, and richest. The wealth quintile was constructed using principal component analysis (PCA). The head of the family or family representative was interviewed using a 30-item tool that was taken from the 2014 Cambodia Demographic Health Survey. The tool is designed to classify households' wealth based on their properties. The binary answer questions were coded with 0 for no and 1 for yes. The questions with non-binary-answer were split into binary questions with a code of 0 for no and 1 for yes [21]. The first score component was used to classify the wealth into five quintiles [21]. The lower score represents the poorer status, and the higher score represents the richer status. The list of questions used for PCA is in the table below.

HOUSEHOLD SOCIO-ECONOMIC STATUS

<i>QH3. Does your household have? [CDHS]</i>		
301. electricity	1=Yes	0=No
302. a radio?	1=Yes	0=No
303. a television?	1=Yes	0=No
304. a mobile telephone?	1=Yes	0=No
305. If yes, is it a smartphone?	1=Yes	0=No
306. a refrigerator?	1=Yes	0=No
307. a wardrobe?	1=Yes	0=No
308. a sewing machine or loom?	1=Yes	0=No
309. CD/DVD player?	1=Yes	0=No
310. a generator/battery/solar panel?	1=Yes	0=No
Does any member of your household own/have ? [CDHS]		
311. a watch?	1=Yes	0=No

312. a bicycle or cyclo?	1=Yes	0=No
313. a motorcycle or motor-scooter?	1=Yes	0=No
314. a motorcycle-cart	1=Yes	0=No
315. a oxcart or horsecart?	1=Yes	0=No
316. a car or truck, tractor or van?	1=Yes	0=No
317. a boat with a motor?	1=Yes	0=No
318. a boat without a motor?	1=Yes	0=No
319. any agricultural land?	1=Yes	0=No
320. any livestock, herds, other farm animals, or poultry?	1=Yes	0=No
321. a bank account?	1=Yes	0=No

322	<p>What is the main material of the floor?</p> <p><i>Record observation</i></p>	<ol style="list-style-type: none"> 1. Earth/sand/clay 2. Dung 3. Wood planks 4. Palm/bamboo 5. Parquet or polished wood 6. Vinyl or Asphalt strips 7. Ceramic tiles 8. Cement tiles 9. Cement 10. Floating house 11. Other (specify)

325	How many rooms in this household are used for sleeping?	Rooms:.....
326	What is the main source of drinking water during the wet season for members of your household?	<ol style="list-style-type: none"> 1. Piped into dwelling 2. Piped to yard/plot 3. Public tap/standpipe 4. Tube well or borehole 5. Protected well 6. Unprotected well 7. Protected spring 8. Unprotected spring 9. Rainwater 10. Tanker truck 11. Cart with small tank 12. Surface water (river/dam/lake/pond/stream/canal/irrigation channel) 13. Bottled water 14. Other (specify)
327	What is the main source of drinking water during the dry season for members of your household?	<ol style="list-style-type: none"> 1. Piped into dwelling 2. Piped to yard/plot 3. Public tap/standpipe 4. Tube well or borehole 5. Protected well 6. Unprotected well 7. Protected spring 8. Unprotected spring 9. Rainwater 10. Tanker truck 11. Cart with small tank 12. Surface water (river/dam/lake/pond/stream/canal/irrigation channel) 13. Bottled water 14. Other (specify)

328	Do you do anything to the water to make it safer to drink?	<ol style="list-style-type: none">1. Yes, always2. Yes, sometime3. No4. Don't know
329	What do you usually do to make the water safer to drink? <i>Record all mentioned.</i>	<ol style="list-style-type: none">1. Boil2. Add bleach/chlorine3. Strain through a cloth4. Use water filter (ceramic/sand/composite/etc.)5. Solar disinfection6. Let it stand and settle7. Other (specify)
330	What kind of toilet facility do members of your household usually use?	<ol style="list-style-type: none">1. Flush to piped sewer system (not shared with other households)2. Flush to septic tank (not shared with other households)3. No facility/bush/field4. Other type of toilet (specify)

Annexure 3. Individual Survey Questionnaire

INTRO:

Hello, my name is ____ and I am from the National Institute of Public Health. You has been randomly selected to participate in this study [on the scaling up of diabetes and hypertension in Cambodia] based on information from your household. The information you give will be kept confidential and no personal details will appear in any record. This interview will take approximately 60 minutes. You do not have to answer any question you don't want to and you can stop the interview at any time. There will also be measurements of your blood pressure, weight and height, waist and hip circumferences during and after the interview, and for tomorrow early morning we would like to test your fasting blood glucose [HbA1c and creatinine level for known and suspected diabetes cases]. We very appreciate your participation and information.

ELIGIBILITY & RECRUITMENT CHECK				
(Instructions: To be filled in by data collectors before participants sign informed consent)				
Q.N	Description & questions	RESPONSE		Ref:
Q1	Has the individual been a usual member of the household and stayed in the household the night before the interview or had not been absent for more than 6 months?	0 = No	1 = Yes	CDHS
Q2	Is the individual 40 or more than 40 of age? <i>IF POSSIBLE, CHECK ID CARD</i>	0 = No	1 = Yes	WHO PEN SOP
	If NO, DO NOT continue.			
Q3	Is the individual physically and mentally capable to answer the questions?	0 = No	1 = Yes	
	If NO, DO NOT continue			
Q4	Are you willing to participate in the study?	0 = No	1 = Yes	
	If NO, DO NOT continue If YES, CONSENT obtained			
Q5. Consent obtained		0 = No	1 = Yes	

SECTION 1: SOCIO-DEMOGRAPHIC INFORMATION					
Q.N	Description & questions	RESPONSE	Type of Variable	Field	Ref:
Q6	How old are you? <i>-Record in years as stated by the participant</i> <i>-Record 99 if don't know</i>	_____ Years	Quantitative discrete	Age	WHO STEPS
Q7	Sex of participant <i>Record sex of the participant as observed</i>	1 = Male 2 = Female	Categorical binary	Sex	WHO STEPS
Q8	What is your marital status?	1=Married or living together 2=Divorced or separated 3=Widowed	Categorical nominal	Marital Status	CDHS

	<i>-Record 88 if refuse to answer</i>	4=Never married and never lived together			
Q9	What is your highest educational level? <i>Record 99 if don't know</i>	1=No formal schooling 2=Less than primary school 3=Primary school 4=Secondary school 5=High school 6=College/University 7=Post graduate degree	Categorical ordinal	Educational level	WHO STEPS
Q10	What is your ethnic group?	1 = Khmer 2 = Vietnamese 3 = Chinese 4 = Cham (Muslim) 5 = Other	Categorical nominal	Ethnicity	WHO STEPS
Q11	Which of the following best describes your main work status within the past 12 months? <i>Record 88 if refuse to answer</i>	1=Household tasks 2=Civil servant 3=Employee of private company/NGO 4=Self-employed farmer 5=Large-scale farmer with employees 6=Self-employed in small business 7=Running a big business with employees 8=Casual worker 9=Working abroad 10=At school (pupil/student) 11=Unemployed or not eligible 12=Retired	Categorical nominal	Occupation	CDHS
Q12	Taking the past year, can you give an estimate of your annual income if I read some options to you? <i>Record 88 if refuse to answer</i>	1 = no earnings 2 = less than or 250 USD 3 = more than 251- 1500 USD 4 = more than 1501 – 3500 USD 5 = more than 3501 USD	Categorical ordinal	Individual income	WHO STEPS

SECTION 2: HEALTH STATUS AND QUALITY OF LIFE

Q.N	Description and Questions	Response	Type of Variable	Field	Ref:
-----	---------------------------	----------	------------------	-------	------

Q13	<p>At this point of time in your life, how would you describe:</p> <p>Q 13.1. Your home situation [____] Q 13.2. Your family relationships [____] Q 13.3. Your finances [____] Q 13.4. Your work situation [____]</p> <p><i>-Record 99 if don't know and 88 if refuse</i></p>	<p>1 = Excellent 2 = Very good 3 = Good 4 = Fair 5 = Poor</p>	Categorical Ordinal	QoLife	GACD book
Q14	<p>How good or bad is your health today?</p> <p><i>-The scale is numbered from 0 to 100. -100 means the best health you can imagine. -0 means the worst health you can imagine. -Please mark an X on the scale to indicate how your health is today.</i></p> <p><i>-Record 99 if don't know and 88 if refuse</i></p>		Quantitative discrete	Gen. Health	EuroQoL
Q15	<p>Have you ever been told by a doctor or other health worker that you have hypertension?</p> <p><i>-Record 99 if don't know/unsure</i></p>	<p>0 = No 1 = Yes</p>	Categorical binary	HT_self-report diagnosis	WHO STEPS
Q16	<p>Have you ever been told by a doctor or other health worker that you have diabetes?</p> <p><i>-Record 99 if don't know/unsure</i></p>	<p>0 = No 1 = Yes</p>	Categorical binary	DM_self-report diagnosis	WHO STEPS

Q17	Have you ever been told by a doctor or other health worker that you have heart problems? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical binary	Co-morbidity (CVD)	WHO STEPS
Q18	Have you ever been told by a doctor or other health worker that you have symptoms suggestive of a stroke? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical binary	Co-morbidity (CVD)	WHO STEPS
Q19	Have you ever been told by a doctor or other health worker that you have chronic kidney disease? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical binary	Co-morbidity (CKD)	WHO STEPS
Q20	How many natural teeth do you have? <i>-Record 99 if don't know</i>	0 = None 1 = 1-9 teeth 2 = 10-19 teeth 3 = 20 teeth or more	Categorical ordinal	Dental health	WHO Oral Health Questionnaire
Q21	During the past 12 months, did your teeth or mouth cause any pain or comfort? <i>-Record 99 if don't know</i>	0 = No 1 = Yes	Categorical binary	Dental health	WHO Oral Health Questionnaire
Q22	Over the last 2 weeks, how often have you been bothered by any of the following problems? Q 22.1. Little interest or pleasure in doing things [____] Q 22.2. Feeling down, depressed, or hopeless. [____] Q 22.3. Trouble falling or staying asleep, or sleeping too much. [____]	0 = Not at all 1 = Several days 2 = More than half the days 3 = Nearly everyday	Categorical ordinal	Mental health	PHQ-9

	<p>Q 22.4. Feeling tired or having little energy. [____]</p> <p>Q 22.5. Poor appetite or overeating [____]</p> <p>Q 22.6. Feeling bad about yourself – or that you are a failure or make yourself or down your family [____]</p> <p>Q 22.7. Trouble concentrating on things, such as reading the newspaper or watching television [____]</p> <p>Q 22.8. Moving or speaking so slowly that other people could have noticed? Or the opposite being so fidgety or restless that you have been moving around a lot more than usual [____]</p> <p>Q 22.9. Thoughts that you would be better off dead or of hurting yourself in some ways [____]</p>				
Q42	<p>We would like to confirm that:</p> <p><i>-This question is for categorizing respondents for the following sections and it is also important to ask respondents to confirm their main conditions in this survey.</i></p> <p><i>-IF the answer is “0”, go to Section 3</i></p> <p><i>-IF the answer is “1”, go to Section 3a</i></p> <p><i>-IF the answer is “2”, go to Section 3b</i></p> <p><i>-IF the answer is “3”, go to Section 3c</i></p>	<p>0 = Neither hypertension nor diabetes</p> <p>1 = Only hypertension</p> <p>2 = Only diabetes</p> <p>3 = Both diabetes and hypertension</p>

SECTION 3: HEALTH CARE UTILIZATION					
Q.N	Description and Questions	Response	Type of Variable	Field	Ref:
Q23	<p>Have you sought medical treatment or advice as an outpatient from anyone in the past 3 months?</p> <p><i>-If No, go to Question 40.</i></p>	<p>0 = No 1 = Yes</p>	Categorical variable	Medical advice	GACD book
Q24	<p>Where did you seek medical advice or treatment for illness in the past 3 months?</p> <p><i>-More than one answer can be selected.</i> <i>-Data collectors can use probes to help respondents determine the types of health facilities in the Response Column.</i> <i>-Record 99 if don't know and 88 if refuse</i></p>	<p>1= National hospital (PP) 2= Provincial hospital (RH) 3= District hospital (RH) 4= Health centre 5= Health post 6= Provincial rehabilitation centre (PRC) or Community-based rehabilitation (CBR) 7= Other public; specify: 8= Private hospital 9= Private clinic 10= Private pharmacy 11= Home/Office of trained health worker/nurse 12= Visit of trained health worker/nurse 13= Other private medical; specify: 14= Shop selling drugs/market 15= Kru Khmer/Magician</p>	Categorical Nominal	Care provider_3M	CDHS and GACD book

		16= Monk/religious leader 17= Traditional birth attendant 18= Oversee medical service 19= Other; specify:			
From Q25-Q39, it is a set of questions that are asked following choices selected in Q24. If 2 or 3 choices were selected in Q24, Q25-Q39 would appear 2 or 3 times, accordingly.					
Q25	How many times did you visit the selected place(s) in Q24 in the past three months?	_____ times	Quantitative discrete	Number of visits	GACD
Q26	How much in total was spent on the treatment at the selected place(s) in Q24? <i>-Record 99 if don't know and 88 if refuse</i>	0 = free/no cost 1 = in kind 2 = _____ Riels	-Categorical nominal - Quantitative Continuous	Cost of treatment	CDHS
Q27	How did you pay for the treatment cost at the selected place(s) in Q24? <i>-Record 99 if don't know and 88 if refuse</i>	1= Health Equity Fund 2= Voucher 3= Fee Exemption 4= NGO 5= National Social Security Fund 6= Community-Based Health Insurance 7= Health Insurance through Employer 8= Other Privately Purchased Commercial Health Insurance	-Categorical nominal	Payment method	GADC adapted to context specific

		9= Wage/income 10= Loan/ Ton Tin 11= Sale of Assets 12= Gift from Relative 13= Savings 14= Other			
Q28	How much in total was spent on transport to go to and return from the selected place(s) in Q24? <i>-Record 99 if don't know and 88 if refuse</i>	0 = free/no cost 1 = in kind 2 = _____ Riels	-Categorical nominal - Quantitative Continuous	Cost of transport	CDHS
Q29	On average how many hours do you spend to get treatment/advices from the selected place(s) in Q24? <i>-Record 99 if don't know and 88 if refuse</i>	_____ Hours	Quantitative continuous	Time spending	GACD book (Adapted)
Q30	How satisfied are you with the effect of your {treatment/care} at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q31	How satisfied are you with the explanations the {doctor/other health professional} has given you about the results of your {treatment/care} at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied	Categorical ordinal	Patient satisfaction of care services	SAPS 2006

Q32	<p>The {doctor/other health professional} at the selected place(s) in Q24 was very careful to check everything when examining you.</p> <p><i>-Record 99 if don't know/unsure</i></p>	<p>0 = Strongly agree 1 = Agree 2 = Not sure 3 = Disagree 4 = Strongly disagree</p>	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q33	<p>At the selected place(s) in Q24, how satisfied were you with the choices you had in decisions affecting your health care?</p> <p><i>-Record 99 if don't know/unsure</i></p>	<p>0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied</p>	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q34	<p>How much of the time did you feel respected by the {doctor/other health professional} at the selected place(s) in Q24?</p> <p><i>-Record 99 if don't know/unsure</i></p>	<p>0 = All of the time 1 = Most of the time 2 = About half the time 3 = Some of the time 4 = None of the time</p>	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q35	<p>At the selected place(s) in Q24, the time you had with the {doctor/other health professional} was too short.</p> <p><i>-Record 99 if don't know/unsure</i></p>	<p>0 = Strongly agree 1 = Agree 2 = Not sure 3 = Disagree 4 = Strongly disagree</p>	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q36	<p>Are you satisfied with the care you received in the selected place(s) in Q24?</p> <p><i>-Record 99 if don't know/unsure</i></p>	<p>0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied</p>	Categorical ordinal	Patient satisfaction of care services	SAPS 2006

1 2 3 4 5 6 7 8 9 10 11	Q37	Did you get your blood pressure measured at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical variable	Access to blood pressure testing	Opinion
12 13 14 15 16 17 18 19	Q38	Did you get your blood glucose tested at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical variable	Access to blood glucose testing	Opinion
20 21 22 23 24 25 26 27 28 29	Q39	Would you recommend the selected place(s) in Q24 to others? <i>-Record 99 if don't know/unsure</i>	1 = Not recommended 2 = Recommend with reservations 3 = Recommend 4 = Highly recommend	Categorical ordinal	Patient satisfaction of care services	Opinion
30 31 32 33 34 35 36 37	Q40	Have you ever had your blood glucose tested in the last three years? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical binary	Testing DM (CoC)	Opinion
38 39 40 41 42 43 44 45 46	Q41	Have you ever had your blood pressure measured in the last three years? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical binary	Testing HT (CoC)	Opinion
47 48 49 50 51 52 53 54 55						

SECTION 3a: HEALTH CARE UTILIZATION FOR HYPERTENSION

Q.N	Description and Questions	Response	Type of Variable	Field	Ref:
Q43a	How long have you lived with hypertension? <i>-Record 99 if don't know/unsure and 88 if refuse</i> <i>-Less than a year is rounded up to one year</i> <i>-Standard rounded up formula is applied.</i>	_____ Years	Quantitative concrete	Durati on HT	Opinion
Q44a	Where were you first diagnosed as having hypertension? <i>-Record 99 if don't know and 88 if refuse</i>	1= National hospital (PP) 2= Provincial hospital (RH) 3= District hospital (RH) 4= Health centre 5= Health post 6= Provincial rehabilitation centre (PRC) or Community-based rehabilitation (CBR) 7= Other public; specify: 8= Private hospital 9= Private clinic 10= Private pharmacy 11= Home/Office of trained health worker/nurse 12= Visit of trained health worker/nurse 13= Other private medical; specify: 14= Shop selling drugs/market 15= Kru Khmer/Magician	Categorical Nominal	Diagnosis HT (CoC)	Opinion

Q34	How much of the time did you feel respected by the {doctor/other health professional} at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = All of the time 1 = Most of the time 2 = About half the time 3 = Some of the time 4 = None of the time	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q35	At the selected place(s) in Q24, the time you had with the {doctor/other health professional} was too short. <i>-Record 99 if don't know/unsure</i>	0 = Strongly agree 1 = Agree 2 = Not sure 3 = Disagree 4 = Strongly disagree	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q36	Are you satisfied with the care you received in the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = Very satisfied 1 = Satisfied 2 = Neither satisfied nor dissatisfied 3 = Dissatisfied 4 = Very dissatisfied	Categorical ordinal	Patient satisfaction of care services	SAPS 2006
Q37	Did you get your blood pressure measured at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical variable	Access to blood pressure testing	Opinion

1 2 3 4 5 6 7 8 9 10 11	Q38	Did you get your blood glucose tested at the selected place(s) in Q24? <i>-Record 99 if don't know/unsure</i>	0 = No 1 = Yes	Categorical variable	Access to blood glucose testing	Opinion
12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60	Q39	Would you recommend the selected place(s) in Q24 to others? <i>-Record 99 if don't know/unsure</i>	1 = Not recommended 2 = Recommend with reservations 3 = Recommend 4 = Highly recommend	Categorical ordinal	Patient satisfaction of care services	Opinion

Note: Health center-based (high) means the OD with high coverage (six out of nine) of health centers with the WHO PEN; Health center-based (low) means the OD with low coverage (six out of 25) of health centers with the WHO PEN

STROBE Statement—Checklist of items that should be included in reports of *cross-sectional studies*

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	1
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	2-3
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	5
Objectives	3	State specific objectives, including any prespecified hypotheses	7
Methods			
Study design	4	Present key elements of study design early in the paper	10
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	10-14
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants	12
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	13-14
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	10, 13, 14
Bias	9	Describe any efforts to address potential sources of bias	12
Study size	10	Explain how the study size was arrived at	12-13
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	15-16
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	15-16
		(b) Describe any methods used to examine subgroups and interactions	15-16
		(c) Explain how missing data were addressed	NA
		(d) If applicable, describe analytical methods taking account of sampling strategy	NA
		(e) Describe any sensitivity analyses	NA
Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	17
		(b) Give reasons for non-participation at each stage	17, 12, 13
		(c) Consider use of a flow diagram	13
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	17
		(b) Indicate number of participants with missing data for each variable of interest	17
Outcome data	15*	Report numbers of outcome events or summary measures	18-19, 22

Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included	19-20, 23-24
		(b) Report category boundaries when continuous variables were categorized	NA
		(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	NA
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	NA
Discussion			
Key results	18	Summarise key results with reference to study objectives	25
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	27-28
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	25-28
Generalisability	21	Discuss the generalisability (external validity) of the study results	27
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	29

*Give information separately for exposed and unexposed groups.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.
