Supplementary Material B: Multivariable associations with stress and protection of maternal and newborn healthcare workers

A forest plot visualizing the adjusted odds ratios with confidence intervals for covariates of interest on the stress and protection outcomes, obtained from ordinal logistic regression models. Values shown in Tables 3 and 4. Results are stratified by survey round and plotted on a log-scaled axis. Sample sizes for respective models are as follows:
Increased Stress: N = 1166 (round 1) and N = 346 (round 3)
Feeling Unprotected: N = 1169 (round 1) and N = 308 (round 3)
