Correction

The following reference was omitted from the paper:

References in the manuscript should be re-numbered accordingly. In the ‘Methods’, section ‘Population attributable risk’, lines 1–3 should have read: “Although ORs and RR may be well suited to assessment of causality, they do not provide information about the potential impact on disease occurrence by eliminating these risk factors.”

In the ‘Potential limitations of the study’, page 7, second paragraph, the second sentence should have read: “In order to interpret a PAR as the proportion of cases caused by a risk factor and thus that could be prevented by its elimination from the target population, causality needs to be proven.”
