**Safety and efficacy of stereotactic body radiation therapy *via* cyberknife combined with S-1 simultaneously followed by sequential S-1 as an initial treatment for locally advanced pancreatic cancer (SILAPANC trial): Study design and rationale of a phase II clinical trial**

**Abstract**

**Introduction:** Upfront surgeries are not beneficial to most patients with pancreatic cancer. Therefore, chemoradiotherapy has been placed more emphasis in locally advanced pancreatic cancer recently. Gemcitabine based regimens or FOLFORINOX has been proven as a standard chemotherapy in pancreatic cancer. However, severe toxicities may prevent the completion of chemotherapy. S-1 has showed better objective response rates and similar overall survival rates and progression free survival rates compared with gemcitabine, revealing that S-1 may be a potential candidate for pancreatic cancer, especially in patients refractory to gemcitabine. Additionally, stereotactic body radiation therapy with cyberknife could provide better efficacy than conventional radiotherapy in pancreatic cancer. Therefore, cyberknife with S-1 simultaneously followed by sequential S-1 as an initial treatment may bring about favorable outcomes but needs further study.

**Methods and analysis:** The SILAPANC trial is a prospective, single-center, one armed and ongoing study. 190 eligible patients are required to initially receive cyberknife with one cycle of S-1 simultaneously. After the concurrent chemoradiotherapy, two or three cycles of S-1 are sequentially given. Doses and

1  
2  
3  
4 fractions depend on the location and volume of the tumor and the adjacent organs at  
5  
6 risk. S-1 is taken orally, twice daily, at a dose of 80 mg/m<sup>2</sup> for 28 days, followed by a  
7  
8 14-day interval. The primary objectives are overall survival and 1-, 2-, 3-, 4- and  
9  
10 5-year overall survival rates. The secondary objectives are cancer specific survival,  
11  
12 progression free survival, time to progression, local control rates, clinical benefit rates,  
13  
14 radiation-induced acute and late toxicities, adverse effects of chemotherapy and  
15  
16 quality of life of patients. Besides, variables most predictive of prognosis would be  
17  
18 identified via multivariate methods.  
19

#### 34 35 36 **Strengths and limitations of this study:** 37

- 38 ■ This is the first study to evaluate the feasibility and efficacy of SBRT with  
39  
40 cyberknife combined with S-1 followed by sequential S-1 initially treated in  
41  
42 patients with locally advanced pancreatic cancer.  
43  
44
- 45 ■ Due to no optimal treatment in locally advanced pancreatic cancer and high  
46  
47 adverse effects of standard chemotherapy, alternative combination therapies with  
48  
49 favorable efficacy and low toxicities are urgent. Cyberknife and S-1 have been  
50  
51 proved effective and low incidences of adverse effects in pancreatic cancer.  
52  
53
- 54 ■ This is a single-center, one arm study. Comparison with other treatment needs to  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 be further investigated after the phase II trial.

- 5  
6 ■ Loss of participants at follow-up is inevitable. Hence, recruitment and duration of  
7  
8 the study may be extended for availability of data for analysis.

## Introduction

Although the incidence rate of pancreatic cancer is not as high as that of other gastrointestinal carcinoma in China, cancer mortalities in males and females ranked sixth and seventh, respectively, in 2013, with a surprising low 5-year survival rate (<5%).<sup>1</sup> Among patients first diagnosed with pancreatic cancer, only 15-20% of these patients are suitable for surgery,<sup>2</sup> and the 5-year survival rate of patients with R0 resection remains <20%.<sup>3-5</sup>

Therefore, better efficacy could not be obtained *via* surgery alone, resulting in great emphasis on adjuvant chemoradiotherapy. In 1997, gemcitabine has been confirmed to be the standard chemotherapy for pancreatic cancer.<sup>6</sup> However, it has not been proven whether gemcitabine can significantly improve prognosis in long term follow-ups, and some patients are refractory to gemcitabine. Hence, there is an urgent need for the development of more effective chemotherapy.

S-1 is the prodrug of 5-fluorouracil (5-FU), which comprise of tegafur, gimeracil (dihydropyrimidine dehydrogenase inhibitor) and oteracil (inhibitor of phosphorylation in the gastrointestinal tract), with a ratio of 1:0.4:1. The first phase II clinical trials revealed good clinical efficacy with S-1.<sup>7</sup> In GEST, S-1 had better objective response rates than gemcitabine. In addition, S-1 is not inferior to gemcitabine in terms of overall survival (OS) rates and progression free survival (PFS) rates. Furthermore, the significant improvement of PFS rates can be achieved by the combination of S-1 and gemcitabine.<sup>8</sup> There was no difference between the incidence rates of the adverse effects of S-1 and gemcitabine. Therefore, S-1 is an alternative for

treating locally advanced or metastatic pancreatic cancer, especially for those resistant to gemcitabine. Although there are no phase III studies on S-1, phase II studies have already shown better disease control rates (52-58%), median OS time (4.5-6.3 months) and tolerable adverse effects in gemcitabine-resistant advanced pancreatic cancers treated with S-1.<sup>9-10</sup>

However, few encouraging results are gained with the combination of S-1 and the other drug.<sup>8, 11-13</sup> As a result, S-1 combined with radiotherapy has been gradually applied for the treatment of pancreatic cancer. Besides, 5-FU has been proven to be radiosensitive; thus, improving clinical efficacy.<sup>14</sup>

Compared with conventional radiation, a single-fraction dose and total dose of the target volume can be increased in stereotactic body radiation therapy (SBRT). In addition, doses of organs at risk would be reduced; thus, effectively improving local control rates and reducing radiation-related toxicity.<sup>15-16</sup> Shorter courses of SBRT also enhance patient's compliance and render the initial of other treatments on schedule possible.<sup>16</sup> Nevertheless, few studies have focused on S-1 combined with SBRT for locally advanced pancreatic cancer. Hence, the efficacy of combining S-1 and SBRT needs to be further confirmed. Based on our experience in treating locally advanced pancreatic cancers, SBRT combined with S-1 followed by sequential S-1 as the initial treatment for locally advanced pancreatic cancer has been proposed to evaluate its clinical efficacy.

## 2. Methods

### 2.1 Study design

This study is a single-center, prospective, single arm and phase II clinical trial designed and sponsored by the Department of Radiation Oncology of Changhai Hospital, which evaluated the safety and efficacy of combining cyberknife with S-1 as an initial treatment in patients with locally advanced pancreatic cancer. After obtaining the patients' written informed consent, their information on baseline characteristics, individual treatment plans and follow-up would be processed by database administrators responsible for this clinical trial. Although FOLFIRINOX and gemcitabine-based chemotherapy have been proven as a standard chemotherapy, side effects, especially gastrointestinal and hematological toxicities, may hamper the completion of the full treatment with these drugs, and probably even result in reduced quality of life. Therefore, the advantage of S-1 in this case due to its features may display a favorable tolerability and safety profile. Presumably, this yields an innovative therapy, if deemed favorable, compared with conventional chemotherapy; and this could be another alternative, or even a recommended therapy, when patients are vulnerable or resistant to gemcitabine. The main rationale for the active recruitment of the SILAPANC trial was to demonstrate the good tolerability of treatment with SBRT *via* cyberknife in combination with S-1, followed by sequential S-1 and to assess a potential therapeutic benefit based on the prognosis of patients.

SLIAPANC trial aims to investigate the efficacy and adverse effects of cyberknife with S-1 in patients with locally advanced pancreatic cancer. This study primarily aims to:

1. Evaluate the prognosis of patients with locally advanced pancreatic cancer after radiochemotherapy;
2. Determine adverse effects attributable to cyberknife or S-1;

The secondary objectives are:

1. To analyze the quality of life of patients with locally advanced pancreatic cancer treated with cyberknife combined with S-1;
2. To demonstrate the potential factors associated with the safety and prognosis of patients with locally advanced pancreatic cancer after radiochemotherapy.

### 2.3 Participants and eligibility

To be eligible for inclusion in the SILAPANC trial, all patients with clinical suspicion for pancreatic cancer, as presented in the imaging studies, were required to receive pathological examinations. If deemed necessary, further high-quality dedicated imaging of the pancreas was performed before enrollment into the study and undergoing any study-related procedures. Biopsies were performed with fine needle aspiration *via* endoscopic ultrasound by experienced gastroenterologists. Specimen sections would be evaluated by two independent pathologists. After confirmed diagnosis of locally advanced pancreatic cancer by pathological examinations, patients should have the willingness and ability to provide an informed consent and

1  
2  
3  
4 comply with subsequent treatment plans, tests and other study procedures.

5  
6 The following inclusion and exclusion criteria would be employed to preserve high  
7  
8 internal validity and reduce risks of SBRT or S-1-induced adverse effects. In our study,  
9  
10 locally advanced pancreatic cancer includes borderline resectable or unresectable  
11  
12 tumors without metastatic pancreatic cancer.  
13

14  
15 Inclusion criteria:

16  
17 (1) Borderline resectable:<sup>17</sup>

18  
19  
20 (a) Pancreatic head/uncinate process:

21  
22 (i) Solid tumor contacts with the common hepatic artery without extension to  
23  
24 the celiac axis or hepatic artery bifurcation, allowing for a safe and complete  
25  
26 resection and reconstruction;  
27

28  
29 (ii) Solid tumor contact with the superior mesenteric artery of  $\leq 180^\circ$ ;

30  
31 (iii) The presence of variant arterial anatomy (such as accessory right hepatic  
32  
33 artery, replaced right hepatic artery, replaced common hepatic artery, and the  
34  
35 origin of replaced or accessory artery), and the presence and degree of tumor  
36  
37 contact should be noted, if present, as it may affect surgical planning.  
38  
39

40  
41 (b) Pancreatic body/tail:

42  
43 (i) Solid tumor contact with the celiac axis of  $\leq 180^\circ$ ;

44  
45 (ii) Solid tumor contact with the celiac axis of  $\geq 180^\circ$  without the involvement  
46  
47 of the aorta, and with intact and uninvolved gastroduodenal artery.  
48

49  
50 (c) Solid tumor contact with superior mesenteric veins or portal veins of  $> 180^\circ$ ,  
51  
52 contact of  $\leq 180^\circ$  with contour irregularity of the vein or thrombosis of the vein,  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 but with a suitable vessel proximal and distal to the site of involvement, allowing  
5  
6 for the safe and complete resection of the tumor and vein reconstruction;  
7

8  
9 (d) Solid tumor contact with the inferior vena cava.

10  
11 (2) Unresectable without metastasis:<sup>17</sup>  
12

13  
14 (a) Pancreatic head/uncinate process:

15  
16 (i) Solid tumor contact with the superior mesenteric artery >180°;  
17

18  
19 (ii) Solid tumor contact with the celiac axis >180°;  
20

21  
22 (iii) Solid tumor contact with the first jejunal superior mesenteric artery  
23  
24 branch;

25  
26 (iv) Unreconstructible superior mesenteric vein/portal vein due to  
27  
28 involvement or occlusion (can be due to tumor or bland thrombus);  
29

30  
31 (v) Contact with most proximal draining jejunal branch into the superior  
32  
33 mesenteric vein.  
34

35  
36 (b) Pancreatic body/tail:

37  
38 (i) Solid tumor contact of >180° with the superior mesenteric artery branch;  
39

40  
41 (ii) Solid tumor contact with the celiac axis and aortic involvement;  
42

43  
44 (iii) Unreconstructible superior mesenteric vein/portal vein to tumor  
45  
46 involvement or occlusion (can be due to tumor or bland thrombus).  
47

48  
49 (3) Age ranging from 18 to 75 years old;

50  
51 (4) Karnofsky performance score (KPS)  $\geq 70$ ;

52  
53 (5) Normal renal function (serum creatinine  $\leq 2.0$  mg/dl);  
54

55  
56 (6) Normal liver function (serum total bilirubin  $\leq 3.0$  mg/dl, serum AST  $\leq 2.5$  of the  
57  
58  
59  
60

1  
2  
3  
4 upper limit of normal, serum ALT  $\leq 2.5$  of the upper limit of normal);

5  
6 (7) Routine blood test: WBC  $\geq 3.5 \times 10^9/L$ , neutrophils  $\geq 1.5 \times 10^9/L$ , hemoglobin  $\geq 80$   
7  
8 g/L, and platelet  $\geq 70 \times 10^9/L$ .

9  
10  
11 Exclusion criteria:

12  
13  
14 (1) Ampulla of Vater cancer;

15  
16 (2) Metastatic pancreatic cancer;

17  
18 (3) Patients who have received surgeries, chemotherapy or other treatments prior to  
19  
20 SBRT;

21  
22 (4) Patients under the age of 18 or above the age of 75;

23  
24 (5) KPS  $< 70$ ;

25  
26 (6) Gastrointestinal inflammation or other diseases (especially active inflammatory  
27  
28 bowel disease, non-healing peptic ulcer, gastrointestinal bleeding or perforation  
29  
30 within six months);

31  
32 (7) Impaired organ functions:

33  
34 (a) Heart failure (NYHA III-IV);

35  
36 (b) Respiratory failure;

37  
38 (c) Renal insufficiency (serum creatinine  $> 2.0$  mg/dl).

39  
40 (d) Hepatic insufficiency (serum total bilirubin  $> 3.0$  mg/dl, serum AST  $> 2.5$  of  
41  
42 the upper limit of normal, serum ALT  $> 2.5$  of the upper limit of normal or  
43  
44 Child-Pugh class B or C);

45  
46 (e) Routine blood test: WBC  $< 3.5 \times 10^9/L$ , neutrophils  $< 1.5 \times 10^9/L$ , hemoglobin  
47  
48  $< 80$  g/L, platelet  $< 70 \times 10^9/L$  or other hematological diseases;

1  
2  
3  
4 (f) Severe nervous system diseases.

5  
6 (8) Pregnant women or lactating women;

7  
8  
9 (9) Patients enrolled in other clinical trials;

10  
11 (10) Patients who did not provide an informed consent.

12  
13  
14 Due to better diagnostic yield, safety and the potential lower risk of peritoneal seeding,  
15  
16 endoscopic ultrasound-guided fine-needle aspiration was preferred for all patients  
17  
18 suspected of pancreatic cancer. However, patients with high risks of bleeding,  
19  
20 pancreatitis or pancreatic fistula were not recommended to receive biopsies. Therefore,  
21  
22 it is crucial and mandatory to establish the clinical diagnosis of pancreatic cancer with  
23  
24 cautiousness by the multidisciplinary team based on medical history and all kinds of  
25  
26 tests before the following treatment.  
27

32

#### 33 34 2.4 Pre-treatment assessment

35  
36 Potential participants with locally advanced pancreatic cancer confirmed by initial  
37  
38 screening were required to undergo a detailed pre-treatment assessment, in order to  
39  
40 exclude any conditions contradictory to SBRT and S-1. Hence, participants would  
41  
42 receive personal interviews with physicians for a detailed explanation of the whole  
43  
44 study and related-treatments. In addition, written informed consent must be provided  
45  
46 prior to the patients' participation to the study, stating their willingness to be treated  
47  
48 according to the study protocol. Furthermore, it is important for these patients to  
49  
50 complete the required laboratory tests and other examinations for the evaluation of  
51  
52 their medical conditions, including blood routine tests, liver and renal function tests,  
53  
54

coagulation function tests, tumor markers, physical examinations and KPS scores.

After collection of data regarding pre-treatment assessment, this information would be carefully checked and sent to the designers for the final approval of the study enrollment and verification of the diagnosis. After successful enrollment into the study, the baseline quality of life of the participants was evaluated before treatment *via* questionnaires (EORTC QLQ-PAN26 and QLQ-C30).

## 2.5 Withdrawal of participants

Participants could withdraw from the study any time for any reason without any consequences. In addition, investigators are required to follow-up the whole treatment in case of radiochemotherapy-related severe adverse effects, in which investigators would stop the treatment temporarily or even exclude patients from the study. Patients who were intolerable from the treatment would definitely receive other alternative therapies based on the guidelines and experience of the multidisciplinary team. For every participant who withdraws from the study, the reasons for withdrawal from treatment should be recorded in detail in the database.

## 2.6 Ethical approval

This study complies with the current Declaration of Helsinki, and the principles of Good Clinical Practice (GCP) guidelines. This clinical trial has been registered and entered in the clinicaltrials.gov database (NCT02704143). This trial will also be carried out in keeping with local legal and regulatory requirements. The study

1  
2  
3  
4 protocol and informed consents are approved by the independent Ethic Committee of  
5  
6 Changhai hospital.  
7

8  
9 Prior to enrollment, the potential candidates would receive information on the study  
10  
11 both verbally and in writing. They would be given one week to decide whether to  
12  
13 participate into the study. Thereafter, informed consent, during which a physician will  
14  
15 explain the nature, scope and possible consequences of the trial to the patient, is  
16  
17 obtained from each patient. The investigators will not assume any demands, including  
18  
19 publishing or reporting of individual patient data, especially data required for this  
20  
21 clinical trial, until a valid consent has been obtained. Patients' data would be kept  
22  
23 strictly confidential within the study, but their pseudonymous medical records and  
24  
25 information would be extracted from the database and reviewed for trial purposes by  
26  
27 authorized individuals other than their treating physicians.  
28

35

## 36 2.7 Study procedures

### 37 2.7.1 Trial overview

38  
39 After the successful assessment and obtaining an informed consent, the participants  
40  
41 would be assigned into the treatment group. Individualized treatment plans would be  
42  
43 made after the simulation, and these would be finally confirmed after a consensus is  
44  
45 reached by two radiation oncologists and a medical physicist. The fractions and  
46  
47 radiation doses of the cyberknife depend on each patient's medical condition, as well  
48  
49 as the spatial location of the tumor and the adjacent organs at risk. Participants were  
50  
51 required to receive SBRT with cyberknife and one cycle of S-1 simultaneously. After  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 the concurrent radiochemotherapy, two or three cycles of S-1 were sequentially given.  
5  
6 Optimization of the combination of cyberknife and S-1 focuses on the interval  
7  
8 between the cyberknife and the initial S-1. However, due to severe adverse effects or  
9  
10 those regarded as grade 3 or 4 toxicity, the doses of radiation or S-1 may be modified  
11  
12 or the interval of each radiation and the initial of S-1 may be delayed, or the treatment  
13  
14 may even be stopped temporarily. These patients would be treated immediately and  
15  
16 properly or, if deemed necessary, under the consultation of the multiple disciplinary  
17  
18 team. For some patients, if they are reluctant to participate in the trial or were  
19  
20 inappropriate for the treatment, as requested evaluated by investigators, they would  
21  
22 withdraw from the study and receive other alternative treatments. Figure 1 illustrates  
23  
24 the flow diagram of the study.  
25  
26  
27

29  
30  
31  
32  
33

### 34 2.7.2 Doses of S-1

35  
36 The doses of S-1 are calculated by the body surface. Hence, patients allocated into the  
37  
38 cyberknife combined with S-1 arm received S-1 orally, twice daily, at a dose of 80  
39  
40 mg/m<sup>2</sup> for 28 days, followed by a 14-day interval.  
41  
42  
43  
44  
45

### 46 2.7.3 CT simulation for treatment planning

47  
48 Each patient fasted for at least eight hours before the simulation. Vacuum bags were  
49  
50 customized with patients in the supine position, according to the patient's body shape  
51  
52 for immobilization during the cyberknife. SBRT was delivered *via* the cyberKnife, an  
53  
54 image-guided frameless stereotactic robotic radiosurgery system (Accuray  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 Corporation, Sunnyvale CA), that consists of a linear accelerator mounted on a robot  
5  
6 arm with six degrees of freedom. In this system, the confluence of a large number of  
7  
8 non-isocentric pencil beams permitted the treatment of irregularly shaped target  
9  
10 volumes with rapid dose falloffs. The cyberKnife tracking system automatically  
11  
12 compensated for the alignment offset and patient motion by adjusting the treatment  
13  
14 isocenter. In addition, a CT based treatment planning system was used at our  
15  
16 institution. Then, plain CT and an enhanced pancreatic parenchymal CT were  
17  
18 performed for radiation treatment planning and target delineation. CT images were  
19  
20 acquired under breath hold (preferably end-expiratory). Pretreatment diagnostic  
21  
22 imaging was co-registered to the simulation CT in cases where the patient was unable  
23  
24 to tolerate intravenous contrast. The scan range included the whole pancreas, at least  
25  
26 10 cm above and below the tumor. Spiral CT was performed with a slice thickness of  
27  
28 1.5 mm, and images were reconstructed in slices of 1.5 mm at most. Intravenous  
29  
30 contrast enhancement was performed with an injection of 80-100 ml of iodixanol, a  
31  
32 flow rate of 2.5 ml/sec, and a delay of 45-55 seconds; as acquired for the pancreatic  
33  
34 parenchymal phase.

39  
40  
41  
42  
43  
44  
45

#### 46 2.7.4 Registration and tracking

47  
48 The co-registrations of biphasic CT images were based on fiducials and anatomical  
49  
50 (spinal) fusion. Before CT simulation, fiducials were implanted using endoscopic  
51  
52 ultrasound or CT guidance. This is pivotal for treatment planning and delivery. CT  
53  
54 simulation was performed 1-3 weeks after fiducial placement. This time interval was  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 required to avoid early fiducial marker displacement or migration. In order to improve  
5  
6 the accuracy of the treatment planning, the recommended number of implanted  
7  
8 fiducials was preferably close to 3-5, but not in the tumor. As a result, given that  
9  
10 fiducials could simulate the spatial location and displacement of the tumor, which was  
11  
12 attributable to respiration, motion tracking was performed by means of the correlation  
13  
14 with these seeds; and fiducial markers rendered the Synchrony system equipped in the  
15  
16 cyberknife feasible. This allowed for respiratory motion tracking during irradiation.  
17  
18 Nevertheless, patients with high risk of bleeding, abdominal infection, pancreatitis or  
19  
20 pancreatic fistula were contradictory to several fiducial implants. Hence, one fiducial  
21  
22 plus X-sight spine and Synchrony Tracking technique would be alternatively used.  
23  
24 Before treatment, direct digital radiography images of the spine would be applied to  
25  
26 detect 6-D errors; and this would be subsequently corrected for X-sight spine tracking  
27  
28 on the patient's positioning. This would enable fiducial tracking during treatment.  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38

### 39 2.7.5 Treatment planning and target delineation

40  
41 After CT simulation, CT images were transferred to the workstation where the target  
42  
43 volumes were contoured by an attending radiation oncologist. Gross tumor volume  
44  
45 (GTV) was delineated as a radiographically evident gross disease by contrast CT  
46  
47 acquired from the portal-venous phase. At the discretion of the physician, clinical  
48  
49 target volume (CTV) encompassing areas of the potential subclinical disease spread  
50  
51 was also designated. In most cases, the CTV equaled GTV. A 2-5 mm expansion  
52  
53 margin was included to determine the planning target volume (PTV). When the tumor  
54  
55  
56  
57  
58  
59  
60

was adjacent to critical organs, the expansion of CTV was avoided. Therefore, an individualized treatment plan would be developed based on tumor geometry and location. Ninety percent of PTV should be covered by the prescription dose. The prescription isodose line was limited to 70-75%, which would restrict the tumor  $D_{max}$ . If dose level violated the constraint of SBRT, the patient would be considered as ineligible for this trial. The single dose of CTV varied from 6.5-9 Gy. In particular, these doses would be reduced if the tumor was approximately one-third or more of the duodenum or stomach circumference, or if the tumor abutted the bowel in only one area, as determined by the relationship of the tumor to the duodenum in axial, coronal and sagittal planes in CT scans, or the space between the tumor and the bowel wall was <3 mm. Normal tissue constraints were according to the American Association of Physicists in Medicine guidelines in TG-101,<sup>18</sup> as presented in Table 1.

Table 1. Critical structures and threshold doses

Organs	Threshold doses (five fractions)	Minimum critical volume below threshold	
Parallel organs			
Liver	21 Gy	700 cc	
Kidney	17.5 Gy	200 cc	
Organs	Threshold doses (five fractions)	Max point dose	Max critical volume above threshold

---

Serial organs			
Spinal cord	23 Gy	30 Gy	0.35 cc
Duodenum	18 Gy	32 Gy	5 cc
Bowel	19.5 Gy	35 Gy	5 cc
Stomach	18 Gy	32 Gy	10 cc
Esophagus	19.5 Gy	35 Gy	5 cc
Colon	25 Gy	38 Gy	20 cc

---

#### 2.7.6 Long-term follow-up

Patients are re-evaluated after cyberknife every one month for the first three months, every 2-3 months for the next two years, and every six months for a total five years. Remissions of symptoms and radiation-related toxicities would be assessed. In addition, they would undergo laboratory tests, physical examinations, analysis of quality of life, KPS scores and imaging studies every month within the first three months. Subsequent examinations in later follow-ups are the same.

#### 2.8 Outcomes

##### 2.8.1 Outcome definitions

Primary outcomes of the study were OS and 1-, 2-, 3-, 4- and 5-year OS rates. OS was defined as the time from the date of enrollment to death from any cause. Patients lost to follow-up, withdrawn, or alive at the end of the follow-up should be kept confidential.

59  
60

Secondary outcomes included cancer specific survival (CSS), PFS, time to progression (TTP), local control rates (LCR), clinical benefit rates (CBR), radiation-induced acute and late toxicities, adverse effects of chemotherapy and quality of life of the patient. Cancer specific survival was the time from inclusion to death caused by the tumor. Progression-free survival was the time from the date of enrollment to the confirmation of disease progression at any site or death from any cause, if this occurred before disease progression. Local control was considered as a lack of enlargement of the tumor volume radiographically or stable/declining standardized uptake values on PET-CT scans. The definition of time to progression was the time from inclusion to the recurrence of the tumor, including local recurrence or metastasis. Clinical benefit rate was the ratio of the number of patients with complete response, partial response, or stable disease to the total number of enrolled patients.

### 2.8.2 Evaluation of outcomes

PFS, TTP, LCR and CBR were all associated with treatment response, as determined by the RECIST criteria (version 1.1). Quality of life would be measured through European Organization for Research and Treatment of Cancer Quality of Life Questionnaires (EORTC QLQ-C30 and QLQ-PAN26). Radiation-induced acute toxicities were adverse effects that occur within 90 days after treatment, and determined by the Radiation Therapy Oncology Group, “Acute radiation morbidity scoring criteria”. Late toxicities occurring three months after SBRT were evaluated by

4 the Radiation Therapy Oncology Group/European Organization for Research on the  
5  
6 Treatment of Cancer, “Late radiation morbidity scoring schema”.  
7  
8  
9

## 10 11 2.9 Sample size determination 12

13  
14 It was assumed that 1-year OS rate was 70% of locally advanced pancreatic cancers  
15  
16 treated with cyberknife combined with S-1. The potential benefit of the regimen was  
17  
18 approximately 20% increase in 1-year OS rate. In order to have 90% power to reject  
19  
20 the null hypothesis if the alternative was true at level  $\alpha = 0.05$ , the required  
21  
22 sample size for our study was 138. Additionally, a loss of 20% of patients due to lost  
23  
24 to follow-up or withdrawn due to adverse effects or other reasons was estimated.  
25  
26 Hence, a total of 190 patients would be enrolled into this study.  
27  
28  
29  
30  
31  
32

## 33 34 2.10 Data analysis 35

36  
37 Statistical testing was performed using SPSS version 20.0 (IBM Corp, Armonk, NY,  
38  
39 USA). All outcomes would be analyzed based on intention-to-treat principle. PFS, OS  
40  
41 and LC were calculated *via* the Kaplan-Meier method compared by the log-rank  
42  
43 (Mantel-Cox) test. Response rates would be compared by a test of proportions.  
44  
45 Further analysis would be performed in subgroups stratified by different factors.  
46  
47  
48  
49  
50

## 51 52 2.11 Data management and quality assurance 53

54  
55 Data regarding the patient’s characteristics, medical history and results of clinical and  
56  
57 laboratory tests or examinations will be kept in a password-protected database at the  
58  
59  
60

1  
2  
3  
4 Department of Radiation Oncology in Changhai hospital, which will only be disclosed  
5  
6 to authorized individuals. The Ethic Committee of Changhai Hospital will be  
7  
8 responsible for data monitoring. In addition, trial conducts will be audited by the  
9  
10 committee every six months after the recruitment of participants. The accuracy of the  
11  
12 data entry into the database will be confirmed by two administrators. The interim  
13  
14 results will be accessed to authorized individuals and reported to the Ethic Committee  
15  
16 of Changhai Hospital, which would make the final decision to terminate the trial if  
17  
18 severe adverse effects frequently occur.  
19

25  
26  
27  
28

### 29 **3. Discussion**

30  
31 S-1 has been considered as an important chemotherapeutic drug in pancreatic cancer.  
32  
33 In addition to convenient oral medication, many studies have verified that S-1 was not  
34  
35 inferior to gemcitabine regarding OS and PFS. In adjuvant therapy, S-1 may be a  
36  
37 candidate drug for a patient refractory to gemcitabine, but without phase III clinical  
38  
39 trials. In addition, radiotherapy combined with S-1 probably contributed to the lower  
40  
41 staging of the tumor, as well as the complication rates of surgeries.<sup>18, 19</sup> It was  
42  
43 elucidated that neoadjuvant radiotherapy with S-1 was beneficial to potential  
44  
45 candidates for radical surgeries, because OS could be improved significantly.<sup>19</sup>  
46  
47  
48  
49 SBRT with cyberknife has been proven with lower radiation-toxicities, higher  
50  
51 accuracy and better efficacy compared with conventional radiotherapy. Therefore, it is  
52  
53 pivotal to evaluate the efficacy of SBRT with S-1 as the initial or even neoadjuvant  
54  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 treatment in locally advanced pancreatic cancer, which may be no inferior to or even  
5  
6 more beneficial to patients than standard chemotherapy with conventional  
7  
8 radiotherapy. However, no prospective clinical trials have provided such investigation.  
9  
10  
11 Hence, the goal of the SILAPANC trial is to assess whether better prognosis could be  
12  
13 achieved with cyberknife in combination with S-1 followed by sequential S-1 as an  
14  
15 initial treatment, which may provide new insights into the treatment of locally  
16  
17 advanced pancreatic cancer.

#### **Authors' contributions:**

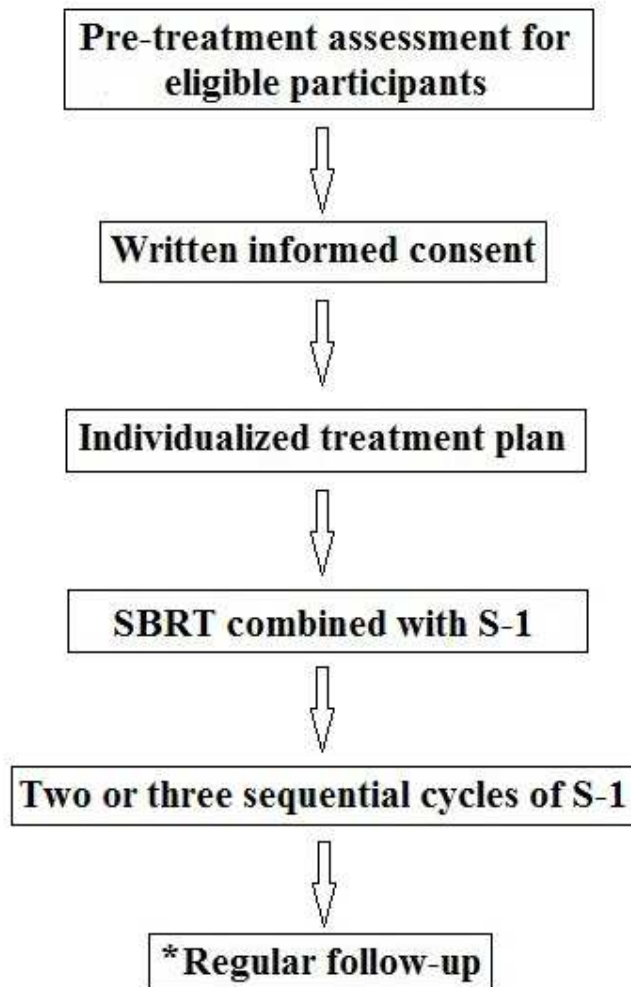

Huojun Zhang was the primary investigator of the study. Xiaofei Zhu and Xiaoping Ju designed the protocol and Huojun Zhang amended it. Xiaofei Zhu, Fei Cao and Fang Fang, were responsible for recruitment of participants. Shuiwang Qing and Yuxin Shen were responsible for data entry. Zhen Jia and Yangsen Cao were responsible for data analysis.

#### **Funding statement:**

This research received no specific grant from any funding agency in the public, commercial or not-for-profit sectors.

#### **Competing interests statement:**

The Authors declare that there is no conflict of interest.

**\*Whether patients should receive thereafter treatment depends on their follow-up.**

## 22 **Abstract**

23  
24 **Introduction:** Upfront surgeries are not beneficial to most patients with pancreatic  
25 cancer. Therefore, chemoradiotherapy has been placed more emphasis in locally  
26 advanced pancreatic cancer recently. Gemcitabine based regimens or FOLFORINOX  
27 has been proven as a standard chemotherapy in pancreatic cancer. However, severe  
28 toxicities may prevent the completion of chemotherapy. S-1 has showed better  
29 objective response rates, similar overall survival rates and progression free survival  
30 rates compared with gemcitabine, revealing that S-1 may be a potential candidate in  
31 treating pancreatic cancer, especially for patients refractory to gemcitabine.  
32  
33 Additionally, stereotactic body radiation therapy with Cyberknife could provide better  
34 efficacy than conventional radiotherapy in pancreatic cancer. Therefore, Cyberknife  
35 with S-1 simultaneously followed by sequential S-1 as an initial treatment may bring  
36 about favorable outcomes but needs further studies.

armed and ongoing study. One hundred and ninety eligible patients are required to initially receive Cyberknife with one cycle of S-1 simultaneously. After the concurrent chemoradiotherapy, two or three cycles of S-1 are sequentially given. Doses and fractions depend on the locations and volumes of tumors and the adjacent organs at risk. S-1 is taken orally, twice daily, at a dose of 80 mg/m<sup>2</sup> for 28 days, followed by a 14-day interval. The primary objectives are overall survival and 1-, 2-, 3-, 4- and 5-year overall survival rates. The secondary objectives are cancer specific survival, progression free survival, time to progression, local control rates, clinical benefit rates, radiation-induced acute and late toxicities, adverse effects of chemotherapy and quality of life of patients. Besides, variables most predictive of prognosis would be identified via multivariate methods.

## 1. Introduction

Although the incidence rate of pancreatic cancer was not as high as that of other gastrointestinal cancer in China, cancer mortalities in males and females ranked the sixth and seventh, respectively, in 2013, with surprising low 5-year survival rates (<5%).<sup>1</sup> Among patients first diagnosed with pancreatic cancer, only 15-20% of these patients were suitable for surgery,<sup>2</sup> and the 5-year survival rate of patients with R0 resection remained <20%.<sup>3-5</sup>

Therefore, better efficacy could not be obtained *via* surgeries alone, resulting in great emphasis on adjuvant chemoradiotherapy. In 1997, gemcitabine has been confirmed to be the standard chemotherapy for pancreatic cancer.<sup>6</sup> However, it has not been proven whether gemcitabine can significantly improve prognosis in long term follow-ups, especially when some patients were refractory to gemcitabine. Hence, there was an urgent need for the development of more effective chemotherapy.

S-1 is the prodrug of 5-fluorouracil (5-FU), which comprises of tegafur, gimeracil (dihydropyrimidine dehydrogenase inhibitor) and oteracil (inhibitor of phosphorylation in the gastrointestinal tract), with a ratio of 1:0.4:1. The first phase II clinical trials revealed good clinical efficacy with S-1.<sup>7</sup> In GEST, S-1 had better objective response rates than gemcitabine. In addition, S-1 was not inferior to gemcitabine in terms of overall survival (OS) rates and progression free survival (PFS) rates. Furthermore, the significant improvement of PFS rates could be achieved by the combination of S-1 and gemcitabine.<sup>8</sup> There was no difference between the incidence rates of the adverse effects of S-1 and gemcitabine. Therefore, S-1 was an alternative

1  
2  
3  
4 for treating locally advanced or metastatic pancreatic cancer, especially for those  
5  
6 resistant to gemcitabine. Although there are no phase III studies on S-1, phase II  
7  
8 studies have already shown better disease control rates (52-58%), median OS time  
9  
10 (4.5-6.3 months) and tolerable adverse effects in gemcitabine-resistant advanced  
11  
12 pancreatic cancers treated with S-1.<sup>9-10</sup>  
13

14  
15  
16 However, few encouraging results were gained with the combination of S-1 and the  
17  
18 other medication.<sup>8, 11-13</sup> As a result, S-1 combined with radiotherapy has been  
19  
20 gradually applied for the treatment of pancreatic cancer. Besides, 5-FU has been  
21  
22 proven to be radiosensitive; thus, improving clinical efficacy.<sup>14</sup>  
23  
24

25  
26 Compared with conventional radiation, a single-fraction dose and the total dose of the  
27  
28 target volume can be increased in stereotactic body radiation therapy (SBRT). In  
29  
30 addition, doses of organs at risk would be reduced; thus, effectively improving local  
31  
32 control rates and reducing radiation-related toxicities.<sup>15-16</sup> Shorter courses of SBRT  
33  
34 also enhance patient's compliance and render the initial of other treatments on  
35  
36 schedule possible.<sup>16</sup> Previous studies on SBRT combined with other chemotherapy  
37  
38 regimens were presented in Table 1. Nevertheless, few studies have focused on S-1  
39  
40 combined with SBRT for locally advanced pancreatic cancer. Hence, the feasibility of  
41  
42 combining S-1 and SBRT needs to be further confirmed. Based on our experience in  
43  
44 treating locally advanced pancreatic cancer, SBRT combined with S-1 followed by  
45  
46 sequential S-1 as the initial treatment for locally advanced pancreatic cancer has been  
47  
48 proposed to evaluate its clinical efficacy.

## 2. Methods

### 2.1 Study design

This study is a single-center, prospective, single arm and phase II clinical trial designed and sponsored by the Department of Radiation Oncology of Changhai Hospital, which evaluated the safety and efficacy of combining Cyberknife with S-1 followed by sequential S-1 as an initial treatment in patients with locally advanced pancreatic cancer. After obtaining the patients' written informed consents, their information about baseline characteristics, individual treatment plans and follow-ups would be processed by database administrators responsible for this clinical trial. Although FOLFIRINOX and gemcitabine-based chemotherapy have been proven as a standard chemotherapy, side effects, especially gastrointestinal and hematological toxicities, may hamper the completion of the full treatment with these drugs, and probably even result in reduced quality of life. Therefore, the advantage of S-1 in this case due to its features may display a favorable tolerability and safety profile. Presumably, this yields an innovative therapy, if deemed favorable, compared with conventional chemotherapy; and this could be another alternative, or even a recommended therapy, when patients are vulnerable or resistant to gemcitabine. The main rationale for the active recruitment of the SILAPANC trial is to demonstrate the good tolerability of treatment with SBRT *via* Cyberknife combined with S-1, followed by sequential S-1 and to assess a potential therapeutic benefit based on the prognosis of patients.

## 2.2 Study objectives

SLIAPANC trial aims to investigate the efficacy and adverse effects of Cyberknife with S-1 in patients with locally advanced pancreatic cancer. The primary objectives are:

1. To evaluate the prognosis of patients with locally advanced pancreatic cancer after radiochemotherapy;
2. To determine adverse effects attributable to Cyberknife or S-1;

The secondary objectives are:

1. To analyze the quality of life of patients with locally advanced pancreatic cancer treated with Cyberknife combined with S-1;
2. To demonstrate the potential factors associated with the safety and prognosis of patients with locally advanced pancreatic cancer after radiochemotherapy.

## 2.3 Participants and eligibility

To be eligible for inclusion in the SILAPANC trial, all patients with clinical suspicion for pancreatic cancer, as presented in the imaging studies, were required to receive pathological examinations. If deemed necessary, further high-quality dedicated imaging of the pancreas should be performed before patients are enrolled into the study and undergo any study-related procedures. Biopsies were performed with fine needle aspiration *via* endoscopic ultrasound by experienced gastroenterologists. Specimen sections would be evaluated by two independent pathologists. After confirmed diagnosis of locally advanced pancreatic cancer by pathological

1  
2  
3  
4 examinations, patients should have the willingness and ability to provide an informed  
5  
6 consent and comply with subsequent treatment plans, tests and other study  
7  
8 procedures.  
9

10  
11 The following inclusion and exclusion criteria would be employed to preserve high  
12  
13 internal validity and reduce risks of SBRT or S-1-induced adverse effects. In our study,  
14  
15 locally advanced pancreatic cancer included borderline resectable or unresectable  
16  
17 tumors without metastatic pancreatic cancer.  
18  
19

20  
21 Inclusion criteria:  
22

23  
24 (1) Borderline resectable.<sup>30</sup>  
25

26  
27 (a) Pancreatic head/uncinate process:  
28

29 (i) Solid tumor contacts with the common hepatic artery without extension to  
30  
31 the celiac axis or hepatic artery bifurcation, allowing for a safe and complete  
32  
33 resection and reconstruction;  
34

35  
36 (ii) Solid tumor contact with the superior mesenteric artery of  $\leq 180^\circ$ ;  
37

38  
39 (iii) The presence of variant arterial anatomy (such as accessory right hepatic  
40  
41 artery, replaced right hepatic artery, replaced common hepatic artery, and the  
42  
43 origin of replaced or accessory artery), and the presence and degree of tumor  
44  
45 contact should be noted, if present, as it may affect surgical planning.  
46  
47

48  
49 (b) Pancreatic body/tail:  
50

51 (i) Solid tumor contact with the celiac axis of  $\leq 180^\circ$ ;  
52

53  
54 (ii) Solid tumor contact with the celiac axis of  $\geq 180^\circ$  without the involvement  
55  
56 of the aorta, and with intact and uninvolved gastroduodenal artery.  
57  
58  
59  
60

- 1  
2  
3  
4 (c) Solid tumor contact with superior mesenteric veins or portal veins of  $>180^\circ$ ,  
5  
6 contact of  $\leq 180^\circ$  with contour irregularity of the vein or thrombosis of the vein,  
7  
8 but with a suitable vessel proximal and distal to the site of involvement, allowing  
9  
10 for the safe and complete resection of the tumor and vein reconstruction;  
11  
12  
13  
14 (d) Solid tumor contact with the inferior vena cava.  
15  
16 (2) Unresectable without metastasis:<sup>30</sup>  
17  
18 (a) Pancreatic head/uncinate process:  
19  
20 (i) Solid tumor contact with the superior mesenteric artery  $>180^\circ$ ;  
21  
22 (ii) Solid tumor contact with the celiac axis  $>180^\circ$ ;  
23  
24 (iii) Solid tumor contact with the first jejunal superior mesenteric artery  
25  
26 branch;  
27  
28 (iv) Unreconstructible superior mesenteric vein/portal vein due to  
29  
30 involvement or occlusion (can be due to tumor or bland thrombus);  
31  
32 (v) Contact with most proximal draining jejunal branch into the superior  
33  
34 mesenteric vein.  
35  
36  
37  
38  
39  
40  
41 (b) Pancreatic body/tail:  
42  
43 (i) Solid tumor contact of  $>180^\circ$  with the superior mesenteric artery branch;  
44  
45 (ii) Solid tumor contact with the celiac axis and aortic involvement;  
46  
47 (iii) Unreconstructible superior mesenteric vein/portal vein to tumor  
48  
49 involvement or occlusion (can be due to tumor or bland thrombus).  
50  
51  
52  
53  
54 (3) Age ranging from 18 to 75 years old;  
55  
56  
57 (4) Karnofsky performance score (KPS)  $\geq 70$ ;  
58  
59  
60

1  
2  
3  
4 (5) Normal renal function (serum creatinine  $\leq 2.0$  mg/dl);

5  
6 (6) Normal liver function (serum total bilirubin  $\leq 3.0$  mg/dl, serum AST  $\leq 2.5$  of the  
7  
8 upper limit of normal, serum ALT  $\leq 2.5$  of the upper limit of normal);

9  
10  
11 (7) Routine blood test: WBC  $\geq 3.5 \times 10^9/L$ , neutrophils  $\geq 1.5 \times 10^9/L$ , hemoglobin  $\geq 80$   
12  
13 g/L, and platelet  $\geq 70 \times 10^9/L$ .

14  
15 Exclusion criteria:

16  
17 (1) Ampulla of Vater cancer;

18  
19 (2) Metastatic pancreatic cancer;

20  
21 (3) Patients who have received surgeries, chemotherapy or other treatments prior to  
22  
23 SBRT;

24  
25 (4) Patients under the age of 18 or above the age of 75;

26  
27 (5) KPS  $< 70$ ;

28  
29 (6) Gastrointestinal inflammation or other diseases (especially active inflammatory  
30  
31 bowel disease, non-healing peptic ulcer, gastrointestinal bleeding or perforation  
32  
33 within six months);

34  
35 (7) Impaired organ functions:

36  
37 (a) Heart failure (NYHA III-IV);

38  
39 (b) Respiratory failure;

40  
41 (c) Renal insufficiency (serum creatinine  $> 2.0$  mg/dl).

42  
43 (d) Hepatic insufficiency (serum total bilirubin  $> 3.0$  mg/dl, serum AST  $> 2.5$  of  
44  
45 the upper limit of normal, serum ALT  $> 2.5$  of the upper limit of normal or  
46  
47 Child-Pugh class B or C);

- 1  
2  
3  
4 (e) Routine blood test: WBC  $<3.5 \times 10^9/L$ , neutrophils  $<1.5 \times 10^9/L$ , hemoglobin  
5  
6  $<80$  g/L, platelet  $<70 \times 10^9/L$  or other hematological diseases;  
7  
8  
9 (f) Severe nervous system diseases.

- 10  
11 (8) Pregnant women or lactating women;  
12  
13 (9) Patients enrolled in other clinical trials;  
14  
15 (10) Patients who did not provide an informed consent.  
16  
17

18  
19 Due to better diagnostic yield, safety and the potential lower risk of peritoneal seeding,  
20  
21 endoscopic ultrasound-guided fine-needle aspiration is preferred for all patients  
22  
23 suspected of pancreatic cancer. However, patients with high risks of bleeding,  
24  
25 pancreatitis or pancreatic fistula were not recommended to receive biopsies. Therefore,  
26  
27 it is crucial and mandatory to establish the clinical diagnosis of pancreatic cancer with  
28  
29 cautiousness by the multidisciplinary team based on medical histories and all kinds of  
30  
31 tests before the following treatment.  
32  
33  
34  
35  
36  
37  
38

#### 39 2.4 Pre-treatment assessment

40  
41 Potential participants with locally advanced pancreatic cancer confirmed by initial  
42  
43 screening were required to undergo a detailed pre-treatment assessment, in order to  
44  
45 exclude any conditions contradictory to SBRT and S-1. Hence, participants would  
46  
47 receive personal interviews with physicians for a detailed explanation of the whole  
48  
49 study and related-treatments. In addition, written informed consents must be provided  
50  
51 prior to the patients' participation to the study, stating their willingness to be treated  
52  
53 according to the study protocol. Furthermore, it is important for these patients to  
54  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 complete the required laboratory tests and other examinations for the evaluation of  
5  
6 their medical conditions, including blood routine tests, liver and renal function tests,  
7  
8 coagulation function tests, tumor markers, physical examinations and KPS scores.  
9

10  
11 After collection of data regarding pre-treatment assessment, this information would be  
12  
13 carefully checked and sent to the designers for the final approval of the study  
14  
15 enrollment and verification of the diagnosis. After successful enrollment into the study,  
16  
17 the baseline quality of life of the participants will be evaluated before treatment *via*  
18  
19 questionnaires (EORTC QLQ-PAN26 and QLQ-C30).  
20  
21  
22  
23  
24  
25

## 26 2.5 Withdrawal of participants

27

28  
29 Participants could withdraw from the study any time for any reasons without any  
30  
31 consequences. In addition, investigators are required to follow-up the whole treatment  
32  
33 in case of radiochemotherapy-related severe adverse effects, in which investigators  
34  
35 would stop the treatment temporarily or even exclude patients from the study. Patients  
36  
37 who are intolerable from the treatment would definitely receive other alternative  
38  
39 therapies based on the guidelines and experience of the multidisciplinary team. For  
40  
41 every participant who withdraws from the study, the reasons for withdrawal from  
42  
43 treatment should be recorded in details in the database.  
44  
45  
46  
47  
48  
49

## 50 2.6 Ethical approval

51

52  
53 This study complies with the current Declaration of Helsinki, and the principles of  
54  
55 Good Clinical Practice (GCP) guidelines. This clinical trial has been registered and  
56  
57  
58  
59  
60

1  
2  
3  
4 entered in the clinicaltrials.gov database (NCT02704143). This trial will also be  
5  
6 carried out in keeping with local legal and regulatory requirements. The study  
7  
8 protocol and informed consents are approved by the independent Ethic Committee of  
9  
10 Changhai hospital.

11  
12  
13  
14 Prior to enrollment, the potential candidates would receive information on the study  
15  
16 both verbally and in writing. They would be given one week to decide whether to  
17  
18 participate into the study. Thereafter, informed consents, during which a physician  
19  
20 will explain the nature, scope and possible consequences of the trial to the patient, is  
21  
22 obtained from each patient. The investigators will not assume any demands, including  
23  
24 publishing or reporting of individual patient's data, especially data required for this  
25  
26 clinical trial, until a valid consent has been obtained. Patients' data would be kept  
27  
28 strictly confidential within the study, but their pseudonymous medical records and  
29  
30 information would be extracted from the database and reviewed for trial purposes by  
31  
32 authorized individuals other than their treating physicians.  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42

## 43 2.7 Study procedures

### 44 2.7.1 Trial overview

45  
46 After the successful assessment, the participants would be assigned into the treatment  
47  
48 group. Individualized treatment plans would be made after the simulation, and these  
49  
50 would be finally confirmed after a consensus is reached by two radiation oncologists  
51  
52 and a medical physicist. The fractions and radiation doses of Cyberknife depend on  
53  
54 each patient's medical condition, as well as the spatial location of the tumor and the  
55  
56  
57  
58  
59  
60

1  
2  
3 adjacent organs at risk. Participants are required to receive SBRT with Cyberknife and  
4  
5 one cycle of S-1 simultaneously. After the concurrent radiochemotherapy, two or three  
6  
7 cycles of S-1 will be sequentially given. Optimization of the combination of  
8  
9 Cyberknife and S-1 focuses on the interval between Cyberknife and the initial of S-1.  
10  
11 However, due to severe adverse effects or those regarded as grade 3 or 4 toxicities, the  
12  
13 doses of radiation or S-1 may be modified or the interval of each radiation and the  
14  
15 initial of S-1 may be delayed, or the treatment may even be stopped temporarily.  
16  
17 These patients would be treated immediately and properly or, if deemed necessary,  
18  
19 under the consultation of the multiple disciplinary team. For some patients, if they are  
20  
21 reluctant to participate in the trial or are inappropriate for the treatment, as requested  
22  
23 evaluated by investigators, they would withdraw from the study and receive other  
24  
25 alternative treatments. Figure 1 illustrates the flow diagram of the study.  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35

### 36 2.7.2 Doses of S-1

37  
38 The doses of S-1 are calculated by the body surface. Hence, patients allocated into  
39  
40 Cyberknife combined with S-1 arm will receive S-1 orally, twice daily, at a dose of 80  
41  
42 mg/m<sup>2</sup> for 28 days, followed by a 14-day interval.  
43  
44  
45  
46  
47

### 48 2.7.3 CT simulation for treatment planning

49  
50 Each patient should fast for at least eight hours before the simulation. Vacuum bags  
51  
52 are customized with patients in the supine position, according to the patient's body  
53  
54 shape for immobilization during Cyberknife. SBRT is delivered *via* Cyberknife, an  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 image-guided frameless stereotactic robotic radiosurgery system (Accuray  
5  
6 Corporation, Sunnyvale CA), that consists of a linear accelerator mounted on a robot  
7  
8 arm with six degrees of freedom. In this system, the confluence of a large number of  
9  
10 non-isocentric pencil beams permits the treatment of irregularly shaped target  
11  
12 volumes with rapid dose falloffs. Cyberknife tracking system automatically  
13  
14 compensates for the alignment offset and patient motions by adjusting the treatment  
15  
16 isocenter. In addition, a CT based treatment planning system is used at our institution.  
17  
18 Then, plain CT and an enhanced pancreatic parenchymal CT are performed for  
19  
20 radiation treatment planning and target delineations. CT images are acquired under  
21  
22 breath hold (preferably end-expiratory). Pretreatment diagnostic imaging would be  
23  
24 co-registered to the simulation CT in cases where the patient is unable to tolerate  
25  
26 intravenous contrast. The scan range includes the whole pancreas, at least 10 cm  
27  
28 above and below the tumor. Spiral CT is performed with a slice thickness of 1.5 mm,  
29  
30 and images are reconstructed in slices of 1.5 mm at most. Intravenous contrast  
31  
32 enhancement is performed with an injection of 80-100 ml of iodixanol, a flow rate of  
33  
34 2.5 ml/sec, and a delay of 45-55 seconds; as acquired for the pancreatic parenchymal  
35  
36 phase.  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48

#### 49 2.7.4 Registration and tracking

50  
51 The co-registrations of biphasic CT images are based on fiducials and anatomical  
52  
53 (spinal) fusion. Before CT simulation, fiducials should be implanted using endoscopic  
54  
55 ultrasound or CT guidance. This is pivotal for treatment planning and delivery. CT  
56  
57  
58  
59  
60

1  
2  
3  
4 simulation will be performed 7-10 days after fiducial placement. This time interval is  
5  
6 required to avoid early fiducial marker displacement or migration. In order to improve  
7  
8 the accuracy of the treatment planning, the recommended number of implanted  
9  
10 fiducials is preferably close to 3-5, but not in the tumor. As a result, given that  
11  
12 fiducials could simulate the spatial location and displacement of the tumor, which is  
13  
14 attributable to respiration, motion tracking should be performed by means of the  
15  
16 correlation with these seeds; and fiducial markers render the Synchrony system  
17  
18 equipped in Cyberknife feasible. This allows for respiratory motion tracking during  
19  
20 irradiation. Nevertheless, patients with high risk of bleeding, abdominal infection,  
21  
22 pancreatitis or pancreatic fistula are contradictory to several fiducial implants. Hence,  
23  
24 one fiducial plus X-sight spine and Synchrony Tracking technique would be  
25  
26 alternatively used. Before treatment, direct digital radiography images of the spine  
27  
28 would be applied to detect 6-D errors; and this would be subsequently corrected for  
29  
30 X-sight spine tracking on the patient's positioning. This would enable fiducial  
31  
32 tracking during treatment.  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43

#### 44 2.7.5 Treatment planning and target delineation

45  
46 After CT simulation, CT images are transferred to the workstation where the target  
47  
48 volumes are contoured by an attending radiation oncologist. Gross tumor volume  
49  
50 (GTV) is delineated as a radiographically evident gross disease by contrast CT  
51  
52 acquired from the portal-venous phase. At the discretion of the physician, clinical  
53  
54 target volume (CTV) encompassing areas of the potential subclinical disease spread is  
55  
56  
57  
58  
59  
60

also designated. In most cases, the CTV equals GTV. A 2-5 mm expansion margin is included to determine the planning target volume (PTV). When the tumor is adjacent to critical organs, the expansion of CTV should be avoided. Therefore, an individualized treatment plan would be developed based on tumor geometries and locations. Ninety percent of PTV should be covered by the prescription dose. The prescription isodose line is limited to 70-75%, which would restrict the tumor  $D_{\max}$ . If dose level violates the constraint of SBRT, the patient would be considered as ineligible for this trial. The single dose of PTV varies from 6.5-9 Gy. In particular, these doses would be reduced if the tumor is approximately one-third or more of the duodenum or stomach circumference, or if the tumor abuts the bowel in only one area, as determined by the relationship of the tumor to the duodenum in axial, coronal and sagittal planes in CT scans, or the space between the tumor and the bowel wall is <3 mm. Normal tissue constraints are according to the American Association of Physicists in Medicine guidelines in TG-101,<sup>31</sup> as presented in Table 2.

Table 2. Critical structures and threshold doses

Organs	Threshold doses (five fractions)	Minimum critical volume below threshold
Parallel organs		
Liver	21 Gy	700 cc
Kidney	17.5 Gy	200 cc

Organs	Threshold doses (five fractions)	Max point dose	Max critical volume above threshold
Serial organs			
Spinal cord	23 Gy	30 Gy	0.35 cc
Duodenum	18 Gy	32 Gy	5 cc
Bowel	19.5 Gy	35 Gy	5 cc
Stomach	18 Gy	32 Gy	10 cc
Esophagus	19.5 Gy	35 Gy	5 cc
Colon	25 Gy	38 Gy	20 cc

### 2.7.6 Long-term follow-up

Patients are re-evaluated after Cyberknife every one month for the first three months, every 2-3 months for the next two years, and every six months for a total five years. Remissions of symptoms and radiation-related toxicities would be assessed. In addition, they would undergo laboratory tests, physical examinations, analysis of quality of life, KPS scores and imaging studies every month within the first three months. Subsequent examinations in later follow-ups are the same.

## 2.8 Outcomes

### 2.8.1 Outcome definitions

Primary outcomes of the study were OS and 1-, 2-, 3-, 4- and 5-year OS rates. OS is defined as the time from the date of enrollment to death from any cause. Patients lost

1  
2  
3  
4 to follow-up, withdrawn, or alive at the end of the follow-up should be kept  
5  
6 confidential.

7  
8  
9 Secondary outcomes include cancer specific survival (CSS), PFS, time to progression  
10  
11 (TTP), local control rates (LCR), clinical benefit rates (CBR), radiation-induced acute  
12  
13 and late toxicities, adverse effects of chemotherapy and quality of life of the patient.  
14  
15 Cancer specific survival is the time from inclusion to death caused by the tumor.  
16  
17 Progression-free survival is the time from the date of enrollment to the confirmation  
18  
19 of disease progression at any sites or death from any causes, if this occurred before  
20  
21 disease progression. Local control is considered as a lack of enlargement of the tumor  
22  
23 volume radiographically or stable/declining standardized uptake values on PET-CT  
24  
25 scans. The definition of time to progression is the time from inclusion to the  
26  
27 recurrence of the tumor, including local recurrence or metastasis. Clinical benefit rate  
28  
29 is the ratio of the number of patients with complete response, partial response, or  
30  
31 stable disease to the total number of enrolled patients.  
32  
33  
34  
35  
36  
37  
38  
39  
40

#### 41 2.8.2 Evaluation of outcomes

42  
43 PFS, TTP, LCR and CBR are all associated with treatment response, as determined by  
44  
45 the RECIST criteria (version 1.1). Quality of life would be measured through  
46  
47 European Organization for Research and Treatment of Cancer Quality of Life  
48  
49 Questionnaires (EORTC QLQ-C30 and QLQ-PAN26). Radiation-induced acute  
50  
51 toxicities are adverse effects that occur within 90 days after treatment, and determined  
52  
53 by the Radiation Therapy Oncology Group, “Acute radiation morbidity scoring  
54  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 criteria". Late toxicities occurring three months after SBRT are evaluated by the  
5

## 10 11 12 13 14 2.9 Sample size determination

15  
16 It was assumed that 1-year OS rate was 70% of locally advanced pancreatic cancers  
17  
18 treated with Cyberknife combined with S-1. The potential benefit of the regimen was  
19  
20 approximately 20% increase in 1-year OS rate. In order to have 90% power to reject  
21  
22 the null hypothesis if the alternative was true at level  $\alpha = 0.05$ , the required  
23  
24 sample size for our study was 138. Additionally, a loss of 20% of patients due to lost  
25  
26 to follow-up or withdrawn due to adverse effects or other reasons was estimated.  
27  
28 Hence, a total of 190 patients would be enrolled into this study.

## 2.10 Data analysis

Statistical testing will be performed using SPSS version 20.0 (IBM Corp, Armonk, NY, USA). All outcomes would be analyzed based on intention-to-treat principle. PFS, OS and LC are calculated *via* the Kaplan-Meier method compared by the log-rank (Mantel-Cox) test. Response rates would be compared by a test of proportions. Further analysis would be performed in subgroups stratified by different factors.

## 2.11 Data management and quality assurance

Data regarding the patient's characteristics, medical histories and results of clinical

1  
2  
3  
4 and laboratory tests or examinations will be kept in a password-protected database at  
5  
6 the Department of Radiation Oncology in Changhai hospital, which will only be  
7  
8 disclosed to authorized individuals. The Ethic Committee of Changhai Hospital will  
9  
10 be responsible for data monitoring. In addition, trial conducts will be audited by the  
11  
12 committee every six months after the recruitment of participants. The accuracy of the  
13  
14 data entry into the database will be confirmed by two administrators. The interim  
15  
16 results will be accessed to authorized individuals and reported to the Ethic Committee  
17  
18 of Changhai Hospital, which would make the final decision to terminate the trial if  
19  
20 severe adverse effects frequently occur.

### 31 **3. Discussion**

32  
33 S-1 has been considered as an important chemotherapeutic drug in pancreatic cancer.  
34  
35 In addition to convenient oral medication, many studies have verified that S-1 was not  
36  
37 inferior to gemcitabine regarding OS and PFS. In adjuvant therapy, S-1 may be a  
38  
39 candidate drug for a patient refractory to gemcitabine, but without phase III clinical  
40  
41 trials. In addition, radiotherapy combined with S-1 probably contributed to the down  
42  
43 staging of the tumor, as well as the lower complication rates of surgeries as the  
44  
45 neoadjuvant therapy.<sup>31, 32</sup> It was elucidated that neoadjuvant radiotherapy with S-1  
46  
47 was beneficial to potential candidates for radical surgeries, because OS could be  
48  
49 improved significantly.<sup>32</sup>  
50  
51  
52  
53  
54

55  
56 SBRT with Cyberknife has been proven with lower radiation-toxicities, higher  
57  
58  
59  
60

1  
2  
3  
4 accuracy and better efficacy compared with conventional radiotherapy. Therefore, it is  
5  
6 pivotal to evaluate the efficacy of SBRT with S-1 as the initial or even neoadjuvant  
7  
8 treatment in locally advanced pancreatic cancer, which may be not inferior to previous  
9  
10 conventional treatment or even more beneficial to patients than standard  
11  
12 chemotherapy with conventional radiotherapy. However, no prospective clinical trials  
13  
14 have provided such investigation. Hence, the goal of the SILAPANC trial is to assess  
15  
16 whether better prognosis could be achieved with Cyberknife combined with S-1  
17  
18 followed by sequential S-1 as an initial treatment, which may provide new insights  
19  
20 into the treatment of locally advanced pancreatic cancer.

**Authors' contributions:**

Huojun Zhang was the primary investigator of the study. Xiaofei Zhu and Xiaoping Ju designed the protocol and Huojun Zhang amended it. Xiaofei Zhu, Fei Cao and Fang Fang, were responsible for recruitment of participants. Shuiwang Qing and Yuxin Shen were responsible for data entry. Zhen Jia and Yangsen Cao were responsible for data analysis.

**Funding statement:**

This research received no specific grant from any funding agency in the public, commercial or not-for-profit sectors.

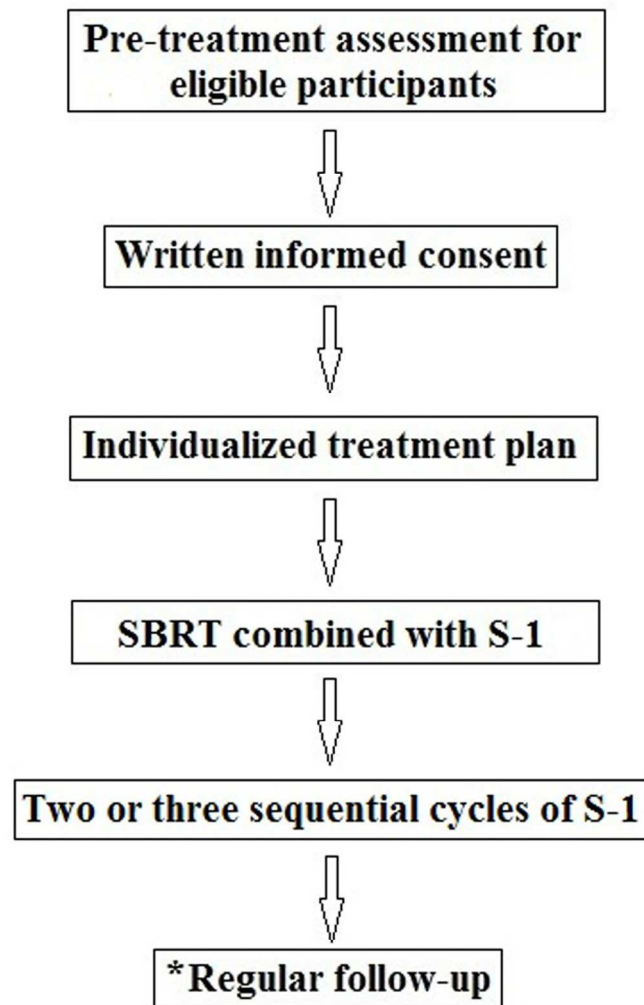

**Competing interests statement:**

The Authors declare that there is no conflict of interest.

**Data sharing statement:**

No additional unpublished data are available.

**\*Whether patients should receive thereafter treatment depends on their follow-up.**

Figure 1 illustrates the flow diagram of the study.

SPIRIT 2013 Checklist: Recommended items to address in a clinical trial protocol and related documents\*

Section/item	Item No	Description	Addressed on page number
<b>Administrative information</b>			
Title	1	Descriptive title identifying the study design, population, interventions, and, if applicable, trial acronym	P3_____
Trial registration	2a	Trial identifier and registry name. If not yet registered, name of intended registry	P4_____
	2b	All items from the World Health Organization Trial Registration Data Set	P4_____
Protocol version	3	Date and version identifier	P4_____
Funding	4	Sources and types of financial, material, and other support	None_____
Roles and responsibilities	5a	Names, affiliations, and roles of protocol contributors	P11_____
	5b	Name and contact information for the trial sponsor	P11_____
	5c	Role of study sponsor and funders, if any, in study design; collection, management, analysis, and interpretation of data; writing of the report; and the decision to submit the report for publication, including whether they will have ultimate authority over any of these activities	P11, 16_____
	5d	Composition, roles, and responsibilities of the coordinating centre, steering committee, endpoint adjudication committee, data management team, and other individuals or groups overseeing the trial, if applicable (see Item 21a for data monitoring committee)	None_____

1  
2  
3 **Introduction**  
4

5 Background and	6a	Description of research question and justification for undertaking the trial, including summary of relevant	P5-6_____
6 rationale		studies (published and unpublished) examining benefits and harms for each intervention	
7			
8	6b	Explanation for choice of comparators	P5-6_____
9			
10 Objectives	7	Specific objectives or hypotheses	P12_____
11			
12 Trial design	8	Description of trial design including type of trial (eg, parallel group, crossover, factorial, single group),	
13		allocation ratio, and framework (eg, superiority, equivalence, noninferiority, exploratory)	P10_____
14			

15  
16 **Methods: Participants, interventions, and outcomes**  
17

18 Study setting	9	Description of study settings (eg, community clinic, academic hospital) and list of countries where data will	P10, 11_____
19		be collected. Reference to where list of study sites can be obtained	
20			
21 Eligibility criteria	10	Inclusion and exclusion criteria for participants. If applicable, eligibility criteria for study centres and	P12-16_____
22		individuals who will perform the interventions (eg, surgeons, psychotherapists)	
23			
24 Interventions	11a	Interventions for each group with sufficient detail to allow replication, including how and when they will be	P18-22_____
25		administered	
26			
27	11b	Criteria for discontinuing or modifying allocated interventions for a given trial participant (eg, drug dose	P22_____
28		change in response to harms, participant request, or improving/worsening disease)	
29			
30	11c	Strategies to improve adherence to intervention protocols, and any procedures for monitoring adherence	P16-17_____
31		(eg, drug tablet return, laboratory tests)	
32			
33	11d	Relevant concomitant care and interventions that are permitted or prohibited during the trial	P17_____
34			
35 Outcomes	12	Primary, secondary, and other outcomes, including the specific measurement variable (eg, systolic blood	P23-25_____
36		pressure), analysis metric (eg, change from baseline, final value, time to event), method of aggregation (eg,	
37		median, proportion), and time point for each outcome. Explanation of the clinical relevance of chosen	
38		efficacy and harm outcomes is strongly recommended	
39			
40			
41 Participant timeline	13	Time schedule of enrolment, interventions (including any run-ins and washouts), assessments, and visits for	P19, 23_____
42		participants. A schematic diagram is highly recommended (see Figure)

Sample size 14 Estimated number of participants needed to achieve study objectives and how it was determined, including clinical and statistical assumptions supporting any sample size calculations P25\_\_\_\_\_

Recruitment 15 Strategies for achieving adequate participant enrolment to reach target sample size P25\_\_\_\_\_

**Methods: Assignment of interventions (for controlled trials)**

Allocation: Non-controlled trial

Sequence generation 16a Method of generating the allocation sequence (eg, computer-generated random numbers), and list of any factors for stratification. To reduce predictability of a random sequence, details of any planned restriction (eg, blocking) should be provided in a separate document that is unavailable to those who enrol participants or assign interventions None\_\_\_\_\_

Allocation concealment mechanism 16b Mechanism of implementing the allocation sequence (eg, central telephone; sequentially numbered, opaque, sealed envelopes), describing any steps to conceal the sequence until interventions are assigned None\_\_\_\_\_

Implementation 16c Who will generate the allocation sequence, who will enrol participants, and who will assign participants to interventions None\_\_\_\_\_

Blinding (masking) 17a Who will be blinded after assignment to interventions (eg, trial participants, care providers, outcome assessors, data analysts), and how None\_\_\_\_\_

17b If blinded, circumstances under which unblinding is permissible, and procedure for revealing a participant's allocated intervention during the trial None\_\_\_\_\_

**Methods: Data collection, management, and analysis**

Data collection methods 18a Plans for assessment and collection of outcome, baseline, and other trial data, including any related processes to promote data quality (eg, duplicate measurements, training of assessors) and a description of study instruments (eg, questionnaires, laboratory tests) along with their reliability and validity, if known. Reference to where data collection forms can be found, if not in the protocol P16, 17\_\_\_\_\_

18b Plans to promote participant retention and complete follow-up, including list of any outcome data to be collected for participants who discontinue or deviate from intervention protocols P18\_\_\_\_\_

1				
2				
3	Data management	19	Plans for data entry, coding, security, and storage, including any related processes to promote data quality (eg, double data entry; range checks for data values). Reference to where details of data management procedures can be found, if not in the protocol	P17, 26_____
4				
5				
6				
7	Statistical methods	20a	Statistical methods for analysing primary and secondary outcomes. Reference to where other details of the statistical analysis plan can be found, if not in the protocol	P25_____
8				
9				
10		20b	Methods for any additional analyses (eg, subgroup and adjusted analyses)	P25_____
11				
12		20c	Definition of analysis population relating to protocol non-adherence (eg, as randomised analysis), and any statistical methods to handle missing data (eg, multiple imputation)	P25_____
13				
14				
15				

### 16 **Methods: Monitoring**

17				
18	Data monitoring	21a	Composition of data monitoring committee (DMC); summary of its role and reporting structure; statement of whether it is independent from the sponsor and competing interests; and reference to where further details about its charter can be found, if not in the protocol. Alternatively, an explanation of why a DMC is not needed	P26_____
19				
20				
21				
22				
23		21b	Description of any interim analyses and stopping guidelines, including who will have access to these interim results and make the final decision to terminate the trial	P26_____
24				
25				
26	Harms	22	Plans for collecting, assessing, reporting, and managing solicited and spontaneously reported adverse events and other unintended effects of trial interventions or trial conduct	P24, 25_____
27				
28				
29	Auditing	23	Frequency and procedures for auditing trial conduct, if any, and whether the process will be independent from investigators and the sponsor	P26_____
30				
31				
32				

### 33 **Ethics and dissemination**

34				
35	Research ethics approval	24	Plans for seeking research ethics committee/institutional review board (REC/IRB) approval	P17, 18_____
36				
37				
38	Protocol amendments	25	Plans for communicating important protocol modifications (eg, changes to eligibility criteria, outcomes, analyses) to relevant parties (eg, investigators, REC/IRBs, trial participants, trial registries, journals, regulators)	None_____
39				
40				
41				
42				
43				
44				
45				

1				
2				
3	Consent or assent	26a	Who will obtain informed consent or assent from potential trial participants or authorised surrogates, and how (see Item 32)	P18_____
4				
5				
6		26b	Additional consent provisions for collection and use of participant data and biological specimens in ancillary studies, if applicable	P18_____
7				
8				
9	Confidentiality	27	How personal information about potential and enrolled participants will be collected, shared, and maintained in order to protect confidentiality before, during, and after the trial	P18, 26_____
10				
11				
12	Declaration of interests	28	Financial and other competing interests for principal investigators for the overall trial and each study site	P33_____
13				
14				
15	Access to data	29	Statement of who will have access to the final trial dataset, and disclosure of contractual agreements that limit such access for investigators	P18, 26_____
16				
17				
18	Ancillary and post-trial care	30	Provisions, if any, for ancillary and post-trial care, and for compensation to those who suffer harm from trial participation	P17_____
19				
20				
21	Dissemination policy	31a	Plans for investigators and sponsor to communicate trial results to participants, healthcare professionals, the public, and other relevant groups (eg, via publication, reporting in results databases, or other data sharing arrangements), including any publication restrictions	P18_____
22				
23				
24				
25				
26		31b	Authorship eligibility guidelines and any intended use of professional writers	None_____
27				
28		31c	Plans, if any, for granting public access to the full protocol, participant-level dataset, and statistical code	None_____
29				
30	<b>Appendices</b>			
31				
32	Informed consent materials	32	Model consent form and other related documentation given to participants and authorised surrogates	P17, 18_____
33				
34				
35	Biological specimens	33	Plans for collection, laboratory evaluation, and storage of biological specimens for genetic or molecular analysis in the current trial and for future use in ancillary studies, if applicable	P12, 16_____
36				
37				

38 \*It is strongly recommended that this checklist be read in conjunction with the SPIRIT 2013 Explanation & Elaboration for important clarification on the items.  
 39 Amendments to the protocol should be tracked and dated. The SPIRIT checklist is copyrighted by the SPIRIT Group under the Creative Commons
