

-Datum-

Dear – mother's name -

The – datum- you were delivered from a baby at X-hospital. After delivery the placenta was examined at our pathology laboratory.

We are investigating how changes in placenta may be related to complications of pregnancy and the health of the child after birth. In this study we examine to what extent benign lesions of the skin in the form of strawberry mark (hemangioma) appear in children who had had some changes in the placenta. We have tried to study this by looking into children's medical records, but we find that the records sometimes give insufficient information. We are therefore addressing you the parents. Did you see, during the first years of your child, changes that resemble the ones described in the attached pictures? The pictures show hemangioma, i.e. benign vascular changes that eventually disappear spontaneously.

Participation in this study is voluntary. If you want that information about your pregnancy and /or your child is not included in these studies, notify us and we are going to erase all the data concerning you. All the data that will be collected in this study are anonymized and treated with high confidentiality.

- We saw similar changes in our child
- We did not see similar changes in our child
- We do not want to participate in these studies and wish therefore that information concerning our child is not included in the study

If you have further questions you are welcome to contact -

Your answer is to be sent in the attached response envelope to -
