## ABSTRACT

**Objective** Surgery remains an inherently male-dominated profession. The aim of this study was to survey women working within the discipline, to understand their current perceptions, providing insight into their practical day-to-day lives, supporting an action-oriented change.

**Design and setting** The link to a confidential, online survey was distributed through the Association of Surgeons of Great Britain and Ireland (ASGBI) social media platforms on Facebook and Twitter over a 2-week period in October 2017.

**Participants** Women working in surgical specialties and actively responding to the link shared through the ASGBI social media platforms. No patients were involved in the study.

**Primary and secondary outcome measures** Data were analysed through a mixed-methods approach. The quantitative data were analysed through descriptive statistics and qualitative analysis was undertaken using a constant comparative analysis of the participants' comments, to identify salient patterns (themes).

**Results** A total of 81 female participants replied (42% response rate based on the Facebook group members), with 88% (n=71) perceiving surgery as a male-dominated field. Over half had experienced discrimination (59%, n=47), while 22% (n=18) perceived a 'glass ceiling' in surgical training. Orthopaedics was reported as the most sexist surgical speciality by 53% (n=43). Accounts of gendered language in the workplace were reported by 59% (n=47), with 32% (n=25) of surveys participants having used it. Overall, a lack of formal mentorship, inflexibility towards part-time careers, gender stereotypes and poor work-life balance were the main perceived barriers for women in surgical careers.

**Conclusion** These findings highlight the implicit nature of the perceived discrimination that women report in their surgical careers. The ASGBI acknowledges these perceptual issues and relative implications as the first of many steps to create an action-oriented change by allowing all staff, regardless of gender, to reflect on their own behaviour, perceptions and the culture in which they work.

## INTRODUCTION

Despite annual intakes of medical school cohorts evidencing a 55% female contingent,

## Strengths and limitations of this study

- This study adopted a multiple methods approach with the qualitative elements enriching the quantitative data on the topics addressed.
- The nature of the survey allowed critical introspection with a useful insight to create the action-oriented change.
- The representativeness and transferability of the data are hindered by the probability that women who had encountered discrimination were more likely to respond to this survey.
- As an online survey, it was not possible to probe to gain a deeper understanding of the comments.

only 28% of these women eventually pursue a career in surgery via higher surgical training in the UK.<sup>1</sup> Beyond these baseline figures, a qualitative analysis of the factors deterring women from pursuing surgery as a career in the Western countries is needed to understand more in depth the nature of these hidden barriers.<sup>2</sup>

In reality, several extraneous variables rooted in sociocultural backgrounds, such as toy makers sometimes blatantly but more often inadvertently, discourage girls from studying science, technology, engineering and mathematics (STEM),<sup>3</sup> as do some of their teachers.<sup>4,5</sup> It is evident that some girls lack role models in these fields and grow up with the unfounded presupposition they would not do well in those, considered male and technical professions.<sup>6</sup> This ultimately influences their intrinsic motivation and their resultant capacity to succeed in fields like surgery, due to the perception that these careers require self-selected individuals who are driven, competitive and able to endure years of intense schooling and high expectations.<sup>7</sup>

Although there is acknowledgement of the long-standing historical contribution to surgical practice from women<sup>8,9</sup> the manner in which women feel perceived by their male counterparts is under evidenced and little reported. The key aim of this study is then to capture the perceived barriers in the experiences of women working within the field of surgery and to use them as a source of reflection for surgical staff of either gender, for policy-makers and for professional bodies such as the Association of Surgeons of Great Britain and Ireland (ASGBI). Acknowledging these issues is the first of many steps to addressing their implication and to help moving beyond tokenism in the coconstruction of relevant, impactful and evidence-based action.<sup>10</sup>

## METHODS

The link to a voluntary, confidential, online survey was distributed through the ASGBI women in surgery social media platforms of Facebook (191 members) and shared via Twitter for a 2-week period in October 2017. Weekly reminders were posted. The Facebook site<sup>11</sup> is a closed group composed of healthcare professionals working in the field of surgery. It is mainly composed by women (90%), aged between 25–34 years (39%) and 35–44 years (30%). The main origin country is the UK (70%), with also contribution from India, Pakistan, USA, Europe and Africa.

The questions were designed to understand whether barriers exist to deter women from pursuing surgery as a career, and if so, what these barriers are and what interventions would be suggested in order to reduce them. Respondents were encouraged to provide their personal opinions throughout the free-text boxes after each question. As the aim of the research was to obtain as many responses as possible, while understanding the participants' experiences of being a female working in surgery, a mixed-methods approach was used. The quantitative data were analysed through descriptive statistics, and to provide context to this data and more fully explore the participants' responses, a qualitative approach was taken using constant comparative analysis of the participants' comments, to identify patterns (themes) within the responses. This was guided by the principles of thematic analysis,<sup>12</sup> using a six-step process of data familiarisation, generating initial codes, searching for themes, reviewing themes, defining and naming themes and producing the report.

Given the sensitivity of the topic, the closed access to the social media platforms, and the wish to ensure honest, open responses and anonymity, no demographic information was collected.

## Patient and public involvement

No patients were involved in the study.

## RESULTS

A total of 81 participants completed the survey, an estimated response rate of 42% based on the Facebook

group membership. It was not possible to determine how the Twitter platform influenced response rate.

## Quantitative analysis

The 88% (n=71) felt that surgery remains a male-dominated field, with 59% (n=47) reporting or witnessing discrimination against females in the workplace. The hidden barriers for women reported by 34% (n=28) were that the profession was not conducive to motherhood and family life, with 16% (n=13) citing childcare issues. There was a perception that the surgical profession and culture was male oriented, conceptualised as an 'old boys club' (16%, n=33) and possessing a masculine attitude and negative bias (13%, n=9). The framework for a career in surgery was reported as lacking flexibility and part-time careers (12%, n=10), with 10% (n=8) citing unsocial hours and working patterns (see [table 1](#)).

The concept of a 'glass ceiling' for women within the surgical profession was raised, with 44% (n=36) feeling this did not exist. All 81 participants answered this question, with 21% (n=17) feeling there was a tangible glass ceiling. The remaining 35% (n=28) chose not to comment.

Respondents were also asked if a glass ceiling existed at any particular levels during surgical training, with 9% (n=7) stating that this was evident at all levels; 6% (n=5) referred women under-representation at consultant role with different treatment compared with males.

Given the lack of women in surgical careers, participants were asked to comment on why women may be attracted to other clinical specialties. The most frequent responses (26%, n=21) were quality of life/work-life balance and less unsocial hours (15%, n=12) (see [table 2](#)).

When asked what could be done to attract more women to the surgical professions, nearly half (42%, n=34) cited improved quality of life, and flexibility in part-time pathways with career and training options (see [table 3](#)).

Although there is existing support for women in surgery, such as less than full-time (LTFT) training and maternity leave, the dearth of women in surgical professions may demonstrate that there is a need for additional support mechanisms. Over 30% of respondents felt that LTFT training was perceived negatively, and this needed to be addressed. There was also a reported need to reduce stigma associated with women taking career breaks (22%, n=18) and to increase understanding of the impact of family on day-to-day activities (18%, n=15) in surgical practice (see [table 4](#)).

To further explore the perceptions of a male-dominated surgical culture, participants were asked to list the specialties in which this dominated. More than half (53%, n=43) felt that trauma and orthopaedics was a sexist specialty, followed by cardiothoracic (16%, n=13) and general surgery (15%, n=12), with 15% reporting no surgical specialty as being more sexist than another (see [table 5](#)).

Over half of respondents (58%, n=47) felt that gendered language exists within surgery. A quarter of the

**Table 1** Participant-perceived barriers to a career in surgery

Barrier	Response, % (n)
Not a profession conducive with motherhood, family and children	34 (28)
Childcare issues	16(13)
'Old boys' club/network	16 (13)
Male attitudes/bias	13 (11)
Culture of surgery as a masculine field	12 (10)
Unconscious bias	12 (10)
Lack of flexible/part-time training	12 (10)
Unsocial hours/working patterns/rotas	10 (8)
Perceptions by nurses and patients that women are not able to be surgeons	7 (6)
Maternity leave/career break	6 (5)
Women are excluded from 'male-only' social events	6 (5)
Women less confident in their abilities	5 (4)
Lack of female role models	5 (4)
Men have more variety in surgical career choices	5 (4)
Male surgeons behaving inappropriately	4 (3)
Patients prefer male surgeons	4 (3)
Image of female surgeons as being on par with a nurse	2 (2)
Perceptions that women will want a less onerous career	2 (2)
Social barriers	2 (2)
Barriers are explicit, not hidden	2 (2)
Lack of flexibility	2 (2)
Women need to be seen as ruthless in order to succeed	2 (2)
Women need to pull their weight like a man	2 (2)
Hard for women to establish a private practice	(1)
Personal expectations	(1)
Historical/traditional expectations of women	(1)
No barriers	4 (3)
Respondent skipped question	7(6)

respondents confessed to having used gendered language themselves, but over half (52%, n=41) had not used it, with gendered language not affecting career choices for 87% (n=70%). The most common method of challenging gendered language was to speak out/correct and state

**Table 2** Benefits of working in non-surgical specialties for women

Quality of life/flexibility/work and life balance	26% (n=21)
More accepting of part-time/less than full-time training	17% (n=14)
Less unsocial hours	15%(n=12)
More role models/mentoring	15% (n=12)
Accepting of childcare and family commitments	10% (n=8)
Less macho/male attitudes	7% (n=6)
Less on call	7% (n=6)
Less intimidating reputation/less competitive	6% (n=5)
Other	21% (n=17)
Not sure/do not know	16% (n=13)
Respondent skipped question	7% (n=6)

inappropriate language (30%, n=24), but 18% (n=15) had not encountered any incidences (see [table 6](#)).

When asked what advice they would give to others when encountering gendered language, the most common recommendation was to confront or speak to the person (51%, n=41), with 17% (n=14) advising correction of the language used (see [table 7](#)).

### Thematic analysis

There was an overarching theme of participants feeling constrained within the present surgical environment,

**Table 3** What could surgery do to attract more women to the profession

Flexible training and career options (eg, part time, less than full time)	42% (n=34)
Project a less masculine image/address this	25% (n=20)
Improve the work/life balance	18% (n=15)
More female mentors/role models	18% (n=15)
More team/collaborative approaches	7% (n=6)
Financial support of trainees	6% (n=5)
Remove the perception of the need for PhDs/to be an academic	3% (n=3)
Sessional work	2% (n=2)
More positions in larger cities	2% (n=2)
Less overbooking	1% (n=2)
More surgical training for medical students	1% (n=1)
Educate surgeons in unconscious bias	1% (n=1)
Nothing	3% (n=3)
Do not know/not sure	5% (n=5)
Respondent skipped question	6% (n=5)

**Table 4** What other support (aside from less than full time (LTFT) and maternity leave) is needed for women in surgery

Change the negative perceptions of LTFT	32% (n=26)
Reduce the perceived stigma associated with women who take career breaks	22% (n=18)
Increase understanding of the perceived impact of family on day to day work activities and support this	18% (n=15)
Encourage men to take LTFT	15% (n=12)
Career break	13% (n=11)
On-site childcare	7% (n=6)
More awareness and promotion of rules, regulations and support of gender equality and support for women	6% (n=5)
Nothing needed	6% (n=5)
Modular training	6% (n=5)
Other	26% (n=21)
Not sure	13% (n=11)

which appears to be better equipped to support males, with sociocultural norms embedded in masculine discourses. The participants appeared to make efforts to fit into the environment, adapting a variety of stances to do this. The constraints were conceptualised as conflicting personal and career decisions, under-representation, a relative rigidity in surgical career structures and the process of discrimination, both active and nuanced (self and others), that exists in current surgical practice. These themes are supported by in vivo quotes from the data:

#### Conflict between personal and career decisions

‘Trainees have families and other responsibilities to manage as well as surgical training’

‘At registrar level, many women switch to GP training for family reasons’

‘Maybe there is a glass ceiling, as the training scheme is long. When you want to have a family you are at senior level for jobs. It is harder to stay focused on

**Table 5** Participant reported sexist surgical specialties

Surgical specialty	Responses, % (n)
Orthopaedics/trauma	53 (43)
Cardiothoracic	16 (13)
General surgery	15 (12)
Urology	5 (4)
None	4 (3)
Vascular	4 (3)
Neurosurgery	4 (3)
Hepatobiliary	(1)
Plastics	(1)
All	(1)
Leading question	(1)
Skipped question	11 (9)
Not sure/do not know	15 (12)

**Table 6** Challenging sexist language in the workplace

Action	Response, % (n)
Speaking up/correcting/stating inappropriate language	30 (24)
Not experienced sexist language	18 (15)
Humour	9 (7)
Find it difficult	7 (6)
Non-confrontational approach/social media	2 (2)
Not able to interpret response	10 (8)
Ignore/refuse to respond	7 (6)

career and your curriculum vitae (CV). This affects the quality of your CV at interview for consultancy. Somehow, it’s easier for wives to follow their surgeon husbands rather than for husbands to follow surgeon wives’

‘I am horrified by the stories of women in the first trimester of pregnancy with morning sickness vomiting several times between procedures during a list, and women in the third trimester doing nights, etc., especially when they want to switch to a less physically intense session’

#### Under-representation

‘Up until recently, there were no women in my sub-specialty’

‘Now that I am a consultant, I feel massively in the minority’

**Table 7** Advice to colleagues on dealing with sexist language in workplace environments

Advice	Response, % (n)
Confront/speak to person involved	51 (41)
Correct the language used	17 (14)
Respondent did not answer	12 (10)
Deflect using humour	11 (9)
Do not accept/remains silent	10 (8)
Ignore	9 (7)
Be aware that people may not be aware they are using sexist language/do not make an issue out of it (unless ‘over the line’)/do not be overly sensitive	7 (6)
Seek support from others/support others	7 (6)
File complaint	3 (2)
Demand apology	(1)
Treat as bullying	(1)
Do not know/no advice	4 (3)

### Rigidity in surgical career structures

‘Reduce the hierarchal nature of surgical training; this would improve safety and morale for all’

‘There needs to be a real understanding that having a small child really hinders the ability to do things like extra work that needs to be completed out of hours. If there was a way to come back into training but have a pause on in counting towards your time up then there would be less financial and timescale stress’

‘Flexible training and to stop having such rigid pathways to CCT (Certificates of Completion of Training), different paths are ok and valid. We also need true competency based training – some people will complete faster than 5/6 years, others might need longer. Be more open to time out.’

‘There’s an implicit assumption that surgeons will be able to have their families trail around the country after them for jobs and fellowships. Realistically this is less possible for women with professional partners and small children. Women are presumed to deskill during maternity leave and discouraged from working part-time.’

### Discrimination: self

‘Generally, women are less confident in their abilities, whereas men are more confident...often holds females back’

‘Some women try and take advantage way over expected norms and use it to bargain for favours which make things worse’

### Discrimination: others

‘People see a glass ceiling, actually you can get in, but you are treated differently, so really a glass cliff’

‘You’re an unlikely looking orthopod’

‘I find the surprise and confusion and refusal to believe I’m an orthopod for example, ‘you’re too nice to be an orthopod’ and ‘that’s not something to be proud of’ very frustrating’

‘I recently presented a paper at a plenary session at a UK surgical meeting. I was the only female presenter. I got equal marks as the top male candidate (announced at the podium by the head of the society) but the prize was given to the male and the prize was a tie’

‘I have done the World Health Organization checklist and then had the comment ‘we need to wait for the surgeon’ despite having introduced myself as the surgeon’

‘I got told by another surgeon that he left vascular surgery for plastics because there were ‘too many women surgeons and they caused too much drama’.

There were reported accounts of patients using gendered language with implicit assumptions that female

surgeons were not acceptable, or that being female was not associated with being a surgeon.

‘Patients don’t think women can be doctors, let alone surgeons’

‘Significantly more patients call me nurse or lady doctor than any of my colleagues’

‘Patients are often shocked that I will be doing their operation, and I have led ward rounds where the patients have talked to my tall male F1 and not me’

‘Patients are extraordinarily sexist for example, patients have walked into a consulting room and said to me ‘I thought I would be seeing a doctor at least’ before I had time to introduce myself. I am 34 and been a doctor for 10 years’

### *Perceived implicit discrimination was reported, but could not be proven*

‘I had difficulty trying to get a consultant job. Although I was already working as a locum consultant, I lost out many times to younger men who were all registrars. Various reasons were cited, but I did begin to wonder if my face didn’t fit. Until a couple of years ago, there were no women in my particular subspecialty’

‘Improve the stigma that is sometimes attached to women who choose to take time out of their careers for children. Many women I’ve spoken to say they aren’t viewed as competent as their full time colleagues’

‘We lose out on consultant posts to younger males’

### *In the physical workplace, there was an account of discrimination*

‘I am the only female Consultant General Surgeon in my Trust. I’m not allowed in the consultant changing room. There is one consultant changing room and it is for men only’

### *Accounts of discrimination were supported by other healthcare staff*

‘Theatre staff have commented that male surgeons get more opportunities in theatre than female’

### *There were also reports of female surgeons being discriminated against by other non-surgical staff*

‘The secretaries in my Trust do not do as much for the female consultants as they are perceived as having taken a ‘man’s job.’

## DISCUSSION

This survey, conducted through the ASGBI social media platforms, illuminates the lived realities of female surgeons in the UK today. Gender bias and discrimination were reported by 59% of the participants irrespective of level of training and experience, suggesting an ancient culture pervading our society since the 1800s, at

the time of the first female surgeon in the UK, Elizabeth Garrett.<sup>13 14</sup>

The greatest perceived barrier to women wanting to pursue and persist with a career in surgery was incongruity with motherhood and childcare commitments (50%). Literature reports a significant level of attrition for women in surgical training,<sup>15</sup> traditionally seen as one of the most competitive and time-consuming specialties<sup>16</sup> with the perception that spending less time in surgical training would compromise competency achievement.<sup>17</sup> Furthermore, there is discrepancy on parental leave policies across hospital trusts and specialties, despite widespread recognition that better support for parents engenders marked benefits for the health and well-being of doctors, their children and ultimately healthcare provision.<sup>18</sup> The general perception is that family-friendliness may be hard to reconcile with the working requirements of the surgical specialty, often involving patient treatment of unknown length or at unsocial times of day or night.<sup>19</sup> There is a challenge to manage work in these areas and to improve family-friendliness without compromising patient care. This lack of support is potentially leading to burn out, since we know that this is ultimately driven by external factors such as excessive working hours, workload and conflicts with family commitments.<sup>13 14</sup> Thus, for some women, the only perceived option to preserve their own mental health is represented by withdrawing from surgical training.

How do we create the change needed? Encouraging and tangible signs of an already emergent cultural change, like day-care facilities and childcare options, are reflected in the wider societal acknowledgement of women in surgery. One example is the New Year's Honours List, where the Royal College of Surgeons of England past president, and first female president, Clare Marx, received a damehood in acknowledgement of her contribution to surgical practice. In addition to this, Jackie Taylor has been chosen as president-elect of the Royal College of Physicians and Surgeons of Glasgow for the first time in its 418-year history, where, for the first time, there is also a female surgical vice-president, Alison Lannigan. While these women are atypical and not necessarily representative of all women in surgery, they act as positive role models for women in the context of career progression. We need strategic encouragement and education about the realities of leadership roles in STEM, along with instigation of evidence-based and effective schemes for gender equality in the workplace, such as the ATHENA SWAN for academic careers.<sup>20</sup>

Visibility of role models is key to increasing current female training rates and public advocacy campaigns through social media facilitate education and awareness of culturally sensitive matters. To this end, the ASGBI launched a Facebook group<sup>11</sup> to bring individuals together for networking and communications about women in surgery, parenting and work-life balance.<sup>11</sup> As primary communication methods, social media are increasingly integrated into the daily routine of

individuals personal activity and practice, with 68% of women and 62% of men using them.<sup>21</sup> We aim to be what we see or what we deal with in our daily practice.<sup>22</sup> The ASGBI #HowIBecameAWomanInSurgery' campaign was created on this basis to shine light on the journey through the training pathways of female surgeons. Since much of a culture is underpinned and shaped by the language used,<sup>23</sup> we advocate for a cultural identification with women becoming surgeons. Sharing the journeys of successful female surgeons aims to inspire and support other members, allowing them to see how frequently encountered barriers were overcome from different perspectives.<sup>24</sup> Evidence of the benefits of mentoring to support women as they progress in their careers is plentiful.<sup>25</sup> Interestingly, this survey revealed great awareness of the benefits of mentoring among female surgeons, but a view in 15% that it currently remains an advantage to be gained primarily in non-surgical specialties. The lack of female role models in surgical leadership and consultancy positions contribute to the perpetration of the white male stereotypical gender role, and those who do not fulfil these characteristics, may believe they cannot make in this environment.<sup>22 26</sup> To address this structural problem, a more diverse senior team could prevent discrimination against women in surgery favouring their hiring and promotion.

Finally, personality traits and behaviours adopted by surgeons are often perceived differently depending on a surgeon's gender, which can have significant impact on an individual's confidence and self-reflection. Respondents to this survey noted being labelled as ruthless in order to succeed (2%), pressured to 'pull their weight like a man' (2%) and admitted a lack of confidence in their ability (5%). Women excel in some areas more typically difficult for their male counterparts, including communication, collaboration and patient centredness.<sup>27</sup> Recent analysis of over 100 000 surgical patients in Canada found that those who were operated on by female surgeons were less likely to die 1 month after their procedure,<sup>28</sup> mirroring a previous study according to which female internal medicine doctors had slightly lower rates of death within 30 days of initial hospitalisation.<sup>29</sup> The authors' possible explanation is that the barriers women face in the surgical environment act as a higher bar to achieve a consultant or leadership role when compared with their male counterparts. Those data need adequate dissemination among healthcare professionals and general population, as in our survey the glass ceiling for women is also represented by nurses and patients (7%).

This study builds on the global commitment for greater female representation and support in STEM. The greatest challenge currently faced, in the opinion of the authors, is the realisation and elimination of unconscious bias existing in surgery. Gender equity is a leadership issue: when more women are in leadership positions, organisations offer employees more generous policies to support workplace gender<sup>30 31</sup> and produce better business results.<sup>32</sup>

Cultural change requires a nucleus of organisational catalysts who are insiders with outsiders' cultural beliefs.<sup>33</sup> In today's workplace, these are colleagues at every level of power and leadership acting to call out insults and affronts, eliminate pay and promotion disparities, and advocate for policies that retain a diverse talent pool. Male surgeon colleagues who already mentor and support females are appreciated, but women, also need to step up and promote themselves.<sup>34</sup> The glass ceiling for women in science is created by people, of either gender, and it can only be broken if all are aware of it and change their behaviour and attitude towards it.

### Limitations

The representativeness and transferability of the results are hindered by the response of the participants to a social media requests through ASGBI, therefore, the findings are reflective of professionals active on social media and might not be representative of the entire female surgical workforce in the UK. Furthermore, those who experienced gender inequalities might have been more likely to answer, or those who were replying may have had recall bias based on the nature of the questions.

Not all participants filled in the free-text boxes and the themes constructed from the written data are the researchers' interpretations of the written responses. Since it was an online survey, it was not possible to probe to gain a deeper understanding of the comments

### Recommendations

The survey posits a current theme of constraints for women working within surgical practice in the UK. The findings should be explored further in National and International Collaborative research for women working in surgery. Interviews and focus groups as methods of data collection would allow participants to speak about their experiences and perspectives in greater detail. A consensus conference, with the guidance and support of regulatory and educational bodies such as ASGBI, could fully explore the barriers faced and work together to produce targeted action plans to address the barriers described.

**More than half of UK female surgeons have experience of workplace discrimination, poll suggests**

*Orthopaedics viewed as most sexist of all surgical specialties, responses show*

More than half of female surgeons in the UK have faced or witnessed discrimination in the workplace, suggest the results of a confidential online poll, published in the online journal **BMJ Open**.

Orthopaedics was seen as the most sexist of all the surgical specialties, the responses showed.

Despite women making up over half of medical school entrants in the UK, less than a third opt for a career in surgery, which is widely acknowledged to be a male-dominated environment.

But few studies have looked at the way in which women feel their male surgical colleagues perceive them.

To address this, the researchers analysed the responses of 81 female surgeons to an online survey (42% response rate) about their perceptions and experiences of working in the field; what obstacles they had faced in their careers; and what they thought would help to overcome these.

The survey was distributed through the Association of Surgeons of Great Britain and Ireland (ASGBI) women in surgery Facebook page and shared on Twitter for two weeks in October 2017.

The ASGBI Facebook group is mainly made up of women (90%), aged between 25 and 34 (39%) and 35-44 (30%). Most surgeons in the group come from the UK (70%), but it also includes doctors from India, Pakistan, USA, Europe and Africa.

Analysis of the responses identified several perceived barriers to a surgical career for women: poor work-life balance; inflexibility over part-time careers; gender stereotyping; and lack of formal mentorship.

Most respondents (88%) felt that surgery remains male-dominated, with nearly six out of 10 (59%) reporting or witnessing discrimination against women in the workplace.

And around one in five (22%) felt that there was a “tangible glass ceiling,” with an overriding feeling that the working culture is geared to men.

Orthopaedics was seen as the most sexist of the surgical specialties (53%), followed by cardiothoracic (16%) and general surgery (13%).

Half of the respondents agreed that motherhood and childcare commitments are the greatest obstacles for women wanting a career in surgery.

There is existing support for mothers working in surgery, but women are “presumed to deskill during maternity leave and are discouraged from working part time,” say the researchers.

With fewer women represented at senior level, this could reinforce the idea that surgery is a male-dominated environment, they suggest.

But respondents felt that patients were often just as guilty of assuming women couldn't be surgeons: “Significantly more patients call me nurse or lady doctor than any of my colleagues,” commented one.

Nearly a third (30%) of respondents said that sexist language should be challenged. Other suggestions for tackling discrimination included more female role models and mentors; destigmatisation of career breaks for women; flexible training/career options; better work-life balance; and improved understanding of the impact of childcare responsibilities on working life.

The study is based on a small online survey, so might not be representative of the female surgical workforce, the authors point out. But the poll nevertheless “illuminates the lived realities of female surgeons in the UK today,” they suggest.

And with around 6 in 10 women reporting experience of discrimination, the responses suggest “an ancient culture pervading our society since the 1800s, at the time of the first female surgeon in the UK, Elizabeth Garrett,” they write.
